

MICROCHIP

**dsPIC33FJ32GP202/204 and
dsPIC33FJ16GP304
Data Sheet**

High-Performance,
16-bit Digital Signal Controllers

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

Trademarks

The Microchip name and logo, the Microchip logo, dsPIC, KEELOQ, KEELOQ logo, MPLAB, PIC, PICmicro, PICSTART, PIC³² logo, rPIC and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

FilterLab, Hampshire, HI-TECH C, Linear Active Thermistor, MXDEV, MXLAB, SEEVAL and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, dsSPEAK, ECAN, ECONOMONITOR, FanSense, HI-TIDE, In-Circuit Serial Programming, ICSP, Mindi, MiWi, MPASM, MPLAB Certified logo, MPLIB, MPLINK, mTouch, Omniscient Code Generation, PICC, PICC-18, PICDEM, PICDEM.net, PICKit, PICtail, REAL ICE, rLAB, Select Mode, Total Endurance, TSHARC, UniWinDriver, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC[®] MCUs and dsPIC[®] DSCs, KEELOQ[®] code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

High-Performance, 16-bit Digital Signal Controllers

Operating Range:

- Up to 40 MIPS operation (@ 3.0-3.6V):
 - Industrial temperature range (-40°C to +85°C)
 - Extended temperature range (-40°C to +125°C)
- Up to 20 MIPS operation (@ 3.0-3.6V):
 - High temperature range (-40°C to +150°C)

High-Performance DSC CPU:

- Modified Harvard architecture
- C compiler optimized instruction set
- 16-bit wide data path
- 24-bit wide instructions
- Linear program memory addressing up to 4M instruction words
- Linear data memory addressing up to 64 Kbytes
- 83 base instructions, mostly one word/one cycle
- Sixteen 16-bit General Purpose Registers
- Two 40-bit accumulators with rounding and saturation options
- Flexible and powerful addressing modes:
 - Indirect
 - Modulo
 - Bit-Reversed
- Software stack
- 16 x 16 fractional/integer multiply operations
- 32/16 and 16/16 divide operations
- Single-cycle multiply and accumulate:
 - Accumulator write back for DSP operations
 - Dual data fetch
- Up to ± 16 -bit shifts for up to 40-bit data

Interrupt Controller:

- 5-cycle latency
- Up to 21 available interrupt sources
- Up to three external interrupts
- Seven programmable priority levels
- Four processor exceptions

On-Chip Flash and SRAM:

- Flash program memory (up to 32 Kbytes)
- Data SRAM (2 Kbytes)
- Boot and General Security for Program Flash

Digital I/O:

- Peripheral Pin Select Functionality
- Up to 35 programmable digital I/O pins
- Wake-up/Interrupt-on-Change for up to 31 pins
- Output pins can drive from 3.0V to 3.6V
- Up to 5.5V output with open drain configuration on 5V tolerant pins with external pull-up
- 4 mA sink on all I/O pins

System Management:

- Flexible clock options:
 - External, crystal, resonator, internal RC
 - Fully integrated Phase-Locked Loop (PLL)
 - Extremely low jitter PLL
- Power-up Timer
- Oscillator Start-up Timer/Stabilizer
- Watchdog Timer with its own RC oscillator
- Fail-Safe Clock Monitor
- Reset by multiple sources

Power Management:

- On-chip 2.5V voltage regulator
- Switch between clock sources in real time
- Idle, Sleep and Doze modes with fast wake-up

Timers/Capture/Compare:

- Timer/Counters, up to three 16-bit timers:
 - Can pair up to make one 32-bit timer
 - One timer runs as Real-Time Clock with external 32.768 kHz oscillator
 - Programmable prescaler
- Input Capture (up to four channels):
 - Capture on up, down or both edges
 - 16-bit capture input functions
 - 4-deep FIFO on each capture
- Output Compare (up to 2 channels):
 - Single or Dual 16-bit Compare mode
 - 16-bit Glitchless PWM Mode

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Communication Modules:

- 4-wire SPI:
 - Framing supports I/O interface to simple codecs
 - Supports 8-bit and 16-bit data
 - Supports all serial clock formats and sampling modes
- I²C™:
 - Full Multi-Master Slave mode support
 - 7-bit and 10-bit addressing
 - Bus collision detection and arbitration
 - Integrated signal conditioning
 - Slave address masking
- UART:
 - Interrupt on address bit detect
 - Interrupt on UART error
 - Wake-up on Start bit from Sleep mode
 - 4-character TX and RX FIFO buffers
 - LIN bus support
 - IrDA® encoding and decoding in hardware
 - High-Speed Baud mode
 - Hardware Flow Control with CTS and RTS

Analog-to-Digital Converters (ADCs):

- 10-bit, 1.1 Msps or 12-bit, 500 ksps conversion:
 - Two and four simultaneous samples (10-bit ADC)
 - Up to 13 input channels with auto-scanning
 - Conversion start can be manual or synchronized with one of four trigger sources
 - Conversion possible in Sleep mode
 - ± 2 LSb max integral nonlinearity
 - ± 1 LSb max differential nonlinearity

CMOS Flash Technology:

- Low-power, high-speed Flash technology
- Fully static design
- 3.3V ($\pm 10\%$) operating voltage
- Industrial and extended temperature
- Low-power consumption

Packaging:

- 28-pin SPDIP/SOIC/SSOP/QFN-S
- 44-pin QFN/TQFP

Note: See [Table 1](#) for the exact peripheral features per device.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 Product Families

The device names, pin counts, memory sizes and peripheral availability of each family are listed below, followed by their pinout diagrams.

TABLE 1: dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 CONTROLLER FAMILIES

| Device | Pins | Program Flash Memory (Kbyte) | RAM (Kbyte) | Remappable Peripherals | | | | | | | 10-Bit/12-Bit ADC | I ² C™ | I/O Pins (Max) | Packages |
|------------------|------|------------------------------|-------------|------------------------|------------------|---------------|-------------------------|------|------------------------------------|-----|-------------------|-------------------|----------------|-------------------------------|
| | | | | Remappable Pins | 16-bit Timer | Input Capture | Output Compare Std. PWM | UART | External Interrupts ⁽²⁾ | SPI | | | | |
| dsPIC33FJ32GP202 | 28 | 32 | 2 | 16 | 3 ⁽¹⁾ | 4 | 2 | 1 | 3 | 1 | 1 ADC, 10 ch | 1 | 21 | SDIP SOIC SSOP QFN-S |
| dsPIC33FJ32GP204 | 44 | 32 | 2 | 26 | 3 ⁽¹⁾ | 4 | 2 | 1 | 3 | 1 | 1 ADC, 13 ch | 1 | 35 | QFN TQFP |

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

1.0 DEVICE OVERVIEW

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “*dsPIC33F/PIC24H Family Reference Manual*”. Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

This document contains device-specific information for the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 Digital Signal Controller (DSC) devices. The dsPIC33F devices contain extensive Digital Signal Processor (DSP) functionality with a high performance 16-bit microcontroller (MCU) architecture.

[Figure 1-1](#) shows a general block diagram of the core and peripheral modules in the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. [Table 1-1](#) lists the functions of the various pins shown in the pinout diagrams.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 1-1: dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 BLOCK DIAGRAM

Note: Not all pins or features are implemented on all device pinout configurations. See “Pin Diagrams” for the specific pins and features present on each device.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 1-1: PINOUT I/O DESCRIPTIONS

| Pin Name | Pin Type | Buffer Type | PPS | Description |
|----------|----------|-------------|-----|--|
| AN0-AN12 | I | Analog | No | Analog input channels. |
| CLKI | I | ST/CMOS | No | External clock source input. Always associated with OSC1 pin function. |
| CLKO | O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. Always associated with OSC2 pin function. |
| OSC1 | I | ST/CMOS | No | Oscillator crystal input. ST buffer when configured in RC mode; CMOS otherwise. |
| OSC2 | I/O | — | No | Oscillator crystal output. Connects to crystal or resonator in Crystal Oscillator mode. Optionally functions as CLKO in RC and EC modes. |
| SOSCI | I | ST/CMOS | No | 32.768 kHz low-power oscillator crystal input; CMOS otherwise. |
| SOSCO | O | — | No | 32.768 kHz low-power oscillator crystal output. |
| CN0-CN30 | I | ST | No | Change notification inputs. Can be software programmed for internal weak pull-ups on all inputs. |
| IC1-IC2 | I | ST | Yes | Capture inputs 1/2. |
| IC7-IC8 | I | ST | Yes | Capture inputs 7/8. |
| OCFA | I | ST | Yes | Compare Fault A input (for Compare Channels 1 and 2). |
| OC1-OC2 | O | — | Yes | Compare outputs 1 through 2. |
| INT0 | I | ST | No | External interrupt 0. |
| INT1 | I | ST | Yes | External interrupt 1. |
| INT2 | I | ST | Yes | External interrupt 2. |
| RA0-RA4 | I/O | ST | No | PORTA is a bidirectional I/O port. |
| RA7-RA10 | I/O | ST | No | |
| RB0-RB15 | I/O | ST | No | PORTB is a bidirectional I/O port. |
| RC0-RC9 | I/O | ST | No | PORTC is a bidirectional I/O port. |
| T1CK | I | ST | No | Timer1 external clock input. |
| T2CK | I | ST | Yes | Timer2 external clock input. |
| T3CK | I | ST | Yes | Timer3 external clock input. |
| U1CTS | I | ST | Yes | UART1 clear to send. |
| U1RTS | O | — | Yes | UART1 ready to send. |
| U1RX | I | ST | Yes | UART1 receive. |
| U1TX | O | — | Yes | UART1 transmit. |
| SCK1 | I/O | ST | Yes | Synchronous serial clock input/output for SPI1. |
| SDI1 | I | ST | Yes | SPI1 data in. |
| SDO1 | O | — | Yes | SPI1 data out. |
| SS1 | I/O | ST | Yes | SPI1 slave synchronization or frame pulse I/O. |
| SCL1 | I/O | ST | No | Synchronous serial clock input/output for I2C1. |
| SDA1 | I/O | ST | No | Synchronous serial data input/output for I2C1. |
| ASCL1 | I/O | ST | No | Alternate synchronous serial clock input/output for I2C1. |
| ASDA1 | I/O | ST | No | Alternate synchronous serial data input/output for I2C1. |
| TMS | I | ST | No | JTAG Test mode select pin. |
| TCK | I | ST | No | JTAG test clock input pin. |
| TDI | I | ST | No | JTAG test data input pin. |
| TDO | O | — | No | JTAG test data output pin. |

Legend: CMOS = CMOS compatible input or output; Analog = Analog input; P = Power
 ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
 PPS = Peripheral Pin Select

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

| Pin Name | Pin Type | Buffer Type | PPS | Description |
|----------|----------|-------------|-----|--|
| PGED1 | I/O | ST | No | Data I/O pin for programming/debugging communication channel 1. |
| PGEC1 | I | ST | No | Clock input pin for programming/debugging communication channel 1. |
| PGED2 | I/O | ST | No | Data I/O pin for programming/debugging communication channel 2. |
| PGEC2 | I | ST | No | Clock input pin for programming/debugging communication channel 2. |
| PGED3 | I/O | ST | No | Data I/O pin for programming/debugging communication channel 3. |
| PGEC3 | I | ST | No | Clock input pin for programming/debugging communication channel 3. |
| VCAP | P | — | No | CPU logic filter capacitor connection. |
| Vss | P | — | No | Ground reference for logic and I/O pins. |
| VREF+ | I | Analog | No | Analog voltage reference (high) input. |
| VREF- | I | Analog | No | Analog voltage reference (low) input. |
| AVDD | P | P | No | Positive supply for analog modules. This pin must be connected at all times. |
| MCLR | I/P | ST | No | Master Clear (Reset) input. This pin is an active-low Reset to the device. |
| Avss | P | P | No | Ground reference for analog modules. |
| VDD | P | — | No | Positive supply for peripheral logic and I/O pins. |

Legend: CMOS = CMOS compatible input or output; Analog = Analog input; P = Power
 ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
 PPS = Peripheral Pin Select

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT DIGITAL SIGNAL CONTROLLERS

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to [Section 4.0 “Memory Organization”](#) in this data sheet for device-specific register and bit information.

2.1 Basic Connection Requirements

Getting started with the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of 16-bit Digital Signal Controllers (DSCs) requires attention to a minimal set of device pin connections before proceeding with development. The following is a list of pin names, which must always be connected:

- All VDD and VSS pins (see [Section 2.2 “Decoupling Capacitors”](#))
- All AVDD and AVSS pins (even if ADC module is not used) (see [Section 2.2 “Decoupling Capacitors”](#))
- VCAP (see [Section 2.3 “CPU Logic Filter Capacitor Connection \(Vcap\)”](#))
- MCLR pin (see [Section 2.4 “Master Clear \(MCLR\) Pin”](#))
- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see [Section 2.5 “ICSP Pins”](#))
- OSC1 and OSC2 pins when external oscillator source is used (see [Section 2.6 “External Oscillator Pins”](#))

Additionally, the following pins may be required:

- VREF+/VREF- pins used when external voltage reference for ADC module is implemented

Note: The AVDD and AVSS pins must be connected independent of the ADC voltage reference source.

2.2 Decoupling Capacitors

The use of decoupling capacitors on every pair of power supply pins, such as VDD, VSS, AVDD and AVSS is required.

Consider the following criteria when using decoupling capacitors:

- **Value and type of capacitor:** Recommendation of 0.1 μF (100 nF), 10-20V. This capacitor should be a low-ESR and have resonance frequency in the range of 20 MHz and higher. It is recommended that ceramic capacitors be used.
- **Placement on the printed circuit board:** The decoupling capacitors should be placed as close to the pins as possible. It is recommended to place the capacitors on the same side of the board as the device. If space is constricted, the capacitor can be placed on another layer on the PCB using a via; however, ensure that the trace length from the pin to the capacitor is within one-quarter inch (6 mm) in length.
- **Handling high frequency noise:** If the board is experiencing high frequency noise, upward of tens of MHz, add a second ceramic-type capacitor in parallel to the above described decoupling capacitor. The value of the second capacitor can be in the range of 0.01 μF to 0.001 μF . Place this second capacitor next to the primary decoupling capacitor. In high-speed circuit designs, consider implementing a decade pair of capacitances as close to the power and ground pins as possible. For example, 0.1 μF in parallel with 0.001 μF .
- **Maximizing performance:** On the board layout from the power supply circuit, run the power and return traces to the decoupling capacitors first, and then to the device pins. This ensures that the decoupling capacitors are first in the power chain. Equally important is to keep the trace length between the capacitor and the power pins to a minimum thereby reducing PCB track inductance.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTION

2.2.1 TANK CAPACITORS

On boards with power traces running longer than six inches in length, it is suggested to use a tank capacitor for integrated circuits including DSCs to supply a local power source. The value of the tank capacitor should be determined based on the trace resistance that connects the power supply source to the device, and the maximum current drawn by the device in the application. In other words, select the tank capacitor so that it meets the acceptable voltage sag at the device. Typical values range from 4.7 μF to 47 μF .

2.3 CPU Logic Filter Capacitor Connection (VCAP)

A low-ESR (< 5 Ohms) capacitor is required on the VCAP pin, which is used to stabilize the voltage regulator output voltage. The VCAP pin must not be connected to VDD, and must have a capacitor between 4.7 μF and 10 μF , 16V connected to ground. The type can be ceramic or tantalum. Refer to [Section 22.0 “Electrical Characteristics”](#) for additional information.

The placement of this capacitor should be close to the VCAP. It is recommended that the trace length not exceed one-quarter inch (6 mm). Refer to [Section 19.2 “On-Chip Voltage Regulator”](#) for details.

2.4 Master Clear ($\overline{\text{MCLR}}$) Pin

The $\overline{\text{MCLR}}$ pin provides for two specific device functions:

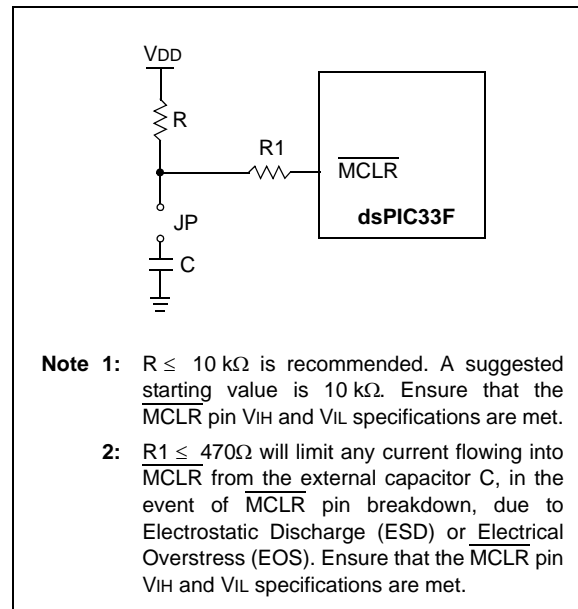

- Device Reset
- Device programming and debugging

During device programming and debugging, the resistance and capacitance that can be added to the pin must be considered. Device programmers and debuggers drive the $\overline{\text{MCLR}}$ pin. Consequently, specific voltage levels (V_{IH} and V_{IL}) and fast signal transitions must not be adversely affected. Therefore, specific values of R and C will need to be adjusted based on the application and PCB requirements.

For example, as shown in [Figure 2-2](#), it is recommended that capacitor C is isolated from the $\overline{\text{MCLR}}$ pin during programming and debugging operations.

Place the components shown in [Figure 2-2](#) within one-quarter inch (6 mm) from the $\overline{\text{MCLR}}$ pin.

FIGURE 2-2: EXAMPLE OF $\overline{\text{MCLR}}$ PIN CONNECTIONS

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

2.5 ICSP Pins

The PGECx and PGEDx pins are used for In-Circuit Serial Programming (ICSP) and debugging purposes. It is recommended to keep the trace length between the ICSP connector and the ICSP pins on the device as short as possible. If the ICSP connector is expected to experience an ESD event, a series resistor is recommended, with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

Ensure that the “Communication Channel Select” (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB® ICD 2, MPLAB ICD 3, or MPLAB REAL ICE™ in-circuit emulator.

For more information on MPLAB ICD 2, MPLAB ICD 3, or MPLAB REAL ICE™ in-circuit emulator connection requirements, refer to the following documents that are available on the Microchip website.

2.6 External Oscillator Pins

Many DSCs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to [Section 8.0 “Oscillator Configuration”](#) for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is shown in [Figure 2-3](#).

FIGURE 2-3: SUGGESTED PLACEMENT OF THE OSCILLATOR CIRCUIT

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

2.7 Oscillator Value Conditions on Device Start-up

If the PLL of the target device is enabled and configured for the device start-up oscillator, the maximum oscillator source frequency must be limited to ≤ 8 MHz for start-up with PLL enabled to comply with device PLL start-up conditions. This means that if the external oscillator frequency is outside this range, the application must start-up in FRC mode first. The default PLL settings after a POR with an oscillator frequency outside this range will violate the device operating speed.

Once the device powers up, the application firmware can initialize the PLL SFRs, CLKDIV and PLLDBF to a suitable value, and then perform a clock switch to the Oscillator + PLL clock source. Note that clock switching must be enabled in the device Configuration word.

2.8 Configuration of Analog and Digital Pins During ICSP Operations

If MPLAB ICD 2, MPLAB ICD 3, or MPLAB REAL ICE in-circuit emulator is selected as a debugger, it automatically initializes all of the A/D input pins (ANx) as “digital” pins, by setting all bits in the AD1PCFGL register.

The bits in the registers that correspond to the A/D pins that are initialized by MPLAB ICD 2, MPLAB ICD 3, or MPLAB REAL ICE in-circuit emulator, must not be cleared by the user application firmware; otherwise, communication errors will result between the debugger and the device.

If your application needs to use certain A/D pins as analog input pins during the debug session, the user application must clear the corresponding bits in the AD1PCFGL register during initialization of the ADC module.

When MPLAB ICD 2, MPLAB ICD 3, or MPLAB REAL ICE in-circuit emulator is used as a programmer, the user application firmware must correctly configure the AD1PCFGL register. Automatic initialization of this register is only done during debugger operation. Failure to correctly configure the register(s) will result in all A/D pins being recognized as analog input pins, resulting in the port value being read as a logic ‘0’, which may affect user application functionality.

2.9 Unused I/Os

Unused I/O pins should be configured as outputs and driven to a logic-low state.

Alternatively, connect a 1k to 10k resistor between Vss and the unused pins.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

3.0 CPU

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 2. “CPU”** (DS70204) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set, including significant support for DSP. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies by device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double word move (MOV.D) instruction and the table instructions. Overhead-free program loop constructs are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a data, address or address offset register. The 16th working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 instruction set has two classes of instructions: MCU and DSP. These two instruction classes are seamlessly integrated into a single CPU. The instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing $A + B = C$ operations to be executed in a single cycle.

A block diagram of the CPU is shown in [Figure 3-1](#). The programmer's model for the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 is shown in [Figure 3-2](#).

3.1 Data Addressing Overview

The data space can be addressed as 32K words or 64 Kbytes and is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. Certain DSP instructions operate through the X and Y AGUs to support dual operand reads, which splits the data address space into two parts. The X and Y data space boundary is device-specific.

Overhead-free circular buffers (Modulo Addressing mode) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU circular addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing to greatly simplify input or output data reordering for radix-2 FFT algorithms.

The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program to data space mapping feature lets any instruction access program space as if it were data space.

3.2 DSP Engine Overview

The DSP engine features a high-speed 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value up to 16 bits right or left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The MAC instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two W registers and accumulating and optionally saturating the result in the same cycle. This instruction functionality requires that the RAM data space be split for these instructions and linear for all others. Data space partitioning is achieved in a transparent and flexible manner through dedicating certain working registers to each address space.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

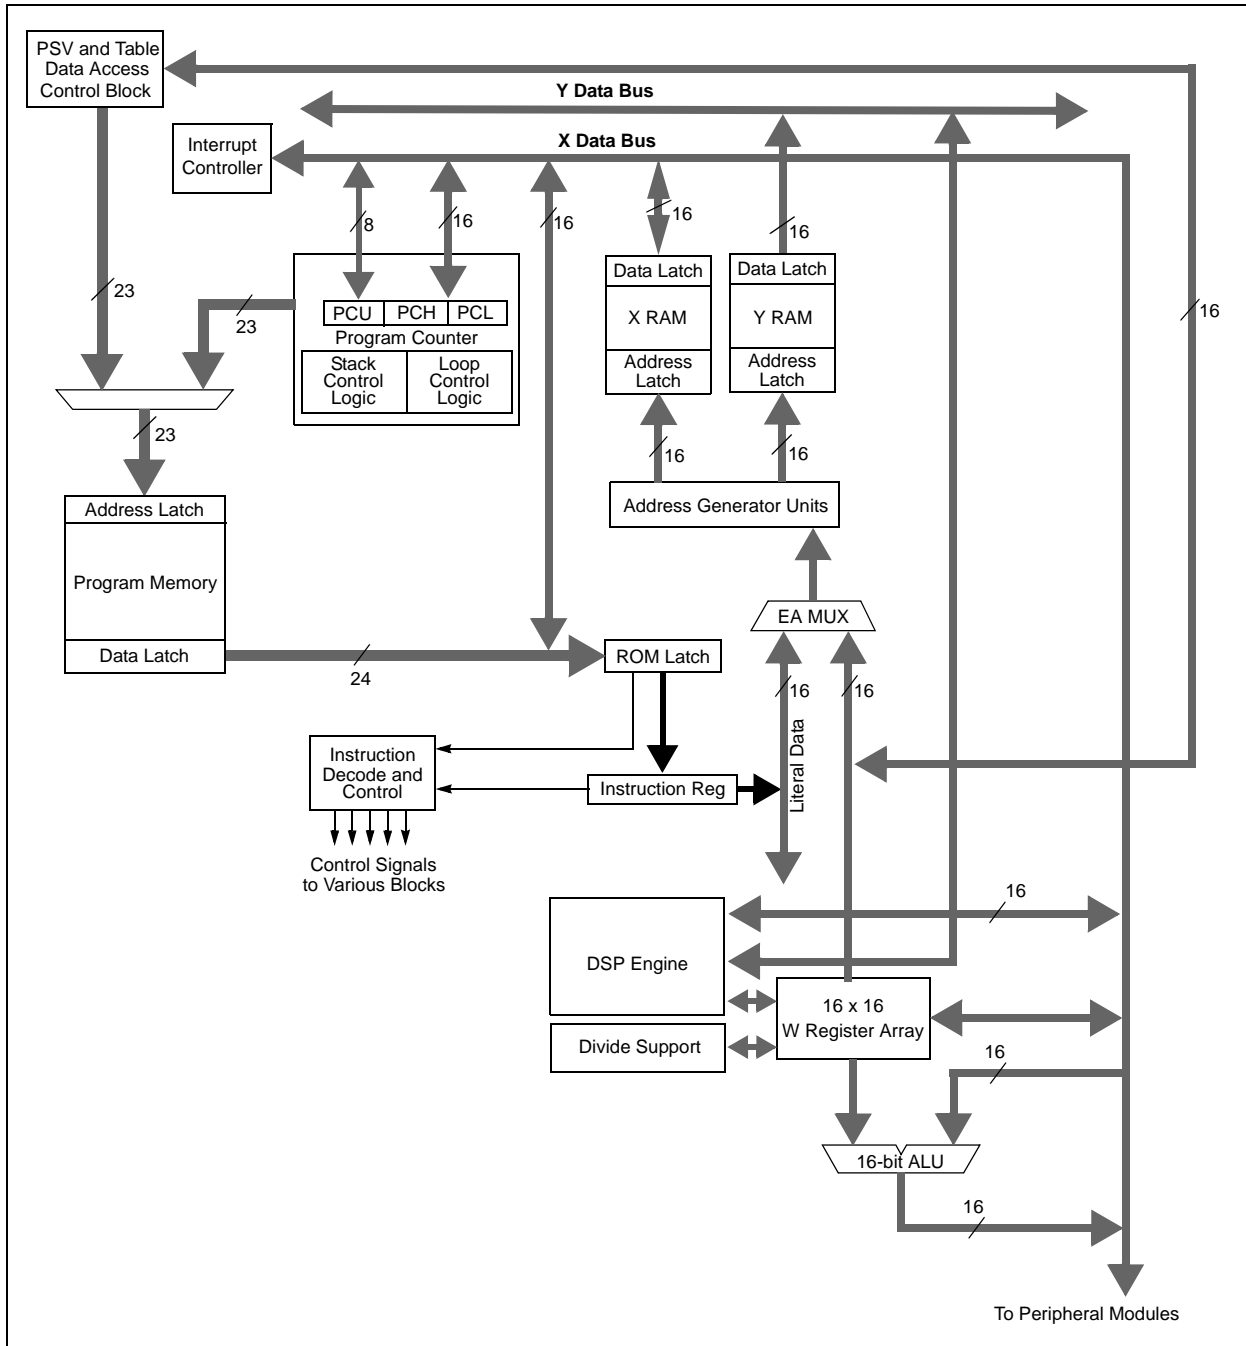

3.3 Special MCU Features

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 features a 17-bit by 17-bit single-cycle multiplier that is shared by both the MCU ALU and DSP engine. The multiplier can perform signed, unsigned and mixed-sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication not only allows you to perform mixed-sign multiplication, it also achieves accurate results for special operations, such as $(-1.0) \times (-1.0)$.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 supports 16/16 and 32/16 divide operations, both fractional and integer. All divide instructions are iterative operations. They must be executed within a REPEAT loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A 40-bit barrel shifter is used to perform up to a 16-bit left or right shift in a single cycle. The barrel shifter can be used by both MCU and DSP instructions.

3.4 CPU Control Registers

CPU control registers include:

- Register 3-1: “SR: CPU Status Register”
- Register 3-2: “CORCON: CORE Control Register”

REGISTER 3-1: SR: CPU STATUS REGISTER

| | | | | | | | |
|--------|-----|-------------------|-------------------|-----|-------|-------|-------|
| R-0 | R-0 | R/C-0 | R/C-0 | R-0 | R/C-0 | R-0 | R/W-0 |
| OA | OB | SA ⁽¹⁾ | SB ⁽¹⁾ | OAB | SAB | DA | DC |
| bit 15 | | | | | | bit 8 | |

| | | | | | | | |
|-------------------------|----------------------|----------------------|-----|-------|-------|-------|-------|
| R/W-0 ⁽²⁾ | R/W-0 ⁽³⁾ | R/W-0 ⁽³⁾ | R-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
| IPL<2:0> ⁽²⁾ | | | RA | N | OV | Z | C |
| bit 7 | | | | | | bit 0 | |

Legend:

| | | |
|--------------------|----------------------|------------------------------------|
| C = Clear only bit | R = Readable bit | U = Unimplemented bit, read as '0' |
| S = Set only bit | W = Writable bit | -n = Value at POR |
| '1' = Bit is set | '0' = Bit is cleared | x = Bit is unknown |

- bit 15 **OA:** Accumulator A Overflow Status bit
 1 = Accumulator A overflowed
 0 = Accumulator A has not overflowed
- bit 14 **OB:** Accumulator B Overflow Status bit
 1 = Accumulator B overflowed
 0 = Accumulator B has not overflowed
- bit 13 **SA:** Accumulator A Saturation 'Sticky' Status bit⁽¹⁾
 1 = Accumulator A is saturated or has been saturated at some time
 0 = Accumulator A is not saturated
- bit 12 **SB:** Accumulator B Saturation 'Sticky' Status bit⁽¹⁾
 1 = Accumulator B is saturated or has been saturated at some time
 0 = Accumulator B is not saturated
- bit 11 **OAB:** OA || OB Combined Accumulator Overflow Status bit
 1 = Accumulators A or B have overflowed
 0 = Neither Accumulators A or B have overflowed
- bit 10 **SAB:** SA || SB Combined Accumulator 'Sticky' Status bit
 1 = Accumulators A or B are saturated or have been saturated at some time in the past
 0 = Neither Accumulator A or B are saturated
Note: This bit can be read or cleared (not set). Clearing this bit will clear SA and SB.
- bit 9 **DA:** DO Loop Active bit
 1 = DO loop in progress
 0 = DO loop not in progress

- Note 1:** This bit can be read or cleared (not set).
- Note 2:** The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.
- Note 3:** The IPL<2:0> Status bits are read only when NSTDIS = 1 (INTCON1<15>).

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

REGISTER 3-1: SR: CPU STATUS REGISTER (CONTINUED)

| | |
|---------|--|
| bit 8 | DC: MCU ALU Half Carry/Borrow bit 1 = A carry-out from the 4th low-order bit (for byte sized data) or 8th low-order bit (for word sized data) of the result occurred 0 = No carry-out from the 4th low-order bit (for byte sized data) or 8th low-order bit (for word sized data) of the result occurred |
| bit 7-5 | IPL<2:0>: CPU Interrupt Priority Level Status bits ⁽²⁾ 111 = CPU Interrupt Priority Level is 7 (15), user interrupts disabled 110 = CPU Interrupt Priority Level is 6 (14) 101 = CPU Interrupt Priority Level is 5 (13) 100 = CPU Interrupt Priority Level is 4 (12) 011 = CPU Interrupt Priority Level is 3 (11) 010 = CPU Interrupt Priority Level is 2 (10) 001 = CPU Interrupt Priority Level is 1 (9) 000 = CPU Interrupt Priority Level is 0 (8) |
| bit 4 | RA: REPEAT Loop Active bit 1 = REPEAT loop in progress 0 = REPEAT loop not in progress |

- bit 0 **IF:** Integer or Fractional Multiplier Mode Select bit
 - 1 = Integer mode enabled for DSP multiply ops
 - 0 = Fractional mode enabled for DSP multiply ops

- Note 1:** This bit will always read as '0'.
- 2:** The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU interrupt priority level.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

3.5 Arithmetic Logic Unit (ALU)

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU can affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit-divisor division.

Refer to the “*dsPIC30F/33F Programmer's Reference Manual*” (DS70157) for information on the SR bits affected by each instruction.

3.5.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier of the DSP engine, the ALU supports unsigned, signed or mixed-sign operation in several MCU multiplication modes:

- 16-bit x 16-bit signed
- 16-bit x 16-bit unsigned
- 16-bit signed x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit unsigned
- 16-bit unsigned x 5-bit (literal) unsigned
- 16-bit unsigned x 16-bit signed
- 8-bit unsigned x 8-bit unsigned

3.5.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 32-bit signed/16-bit signed divide
- 32-bit unsigned/16-bit unsigned divide
- 16-bit signed/16-bit signed divide
- 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. 16-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m+1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

3.6 DSP Engine

The DSP engine consists of a high-speed 17-bit x 17-bit multiplier, a barrel shifter and a 40-bit adder/subtractor (with two target accumulators, round and saturation logic).

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 is a single-cycle instruction flow architecture; therefore, concurrent operation of the DSP engine with MCU instruction flow is not possible. However, some MCU ALU and DSP engine resources can be used concurrently by the same instruction (e.g., ED, EDAC).

The DSP engine can also perform accumulator-to-accumulator operations that require no additional data. These instructions are ADD, SUB and NEG.

The DSP engine has options selected through bits in the CPU Core Control register (CORCON), as listed below:

- Fractional or integer DSP multiply (IF)
- Signed or unsigned DSP multiply (US)
- Conventional or convergent rounding (RND)
- Automatic saturation on/off for AccA (SATA), AccB (SATB) and writes to data memory (SATDW)
- Accumulator Saturation mode selection (ACC-SAT)

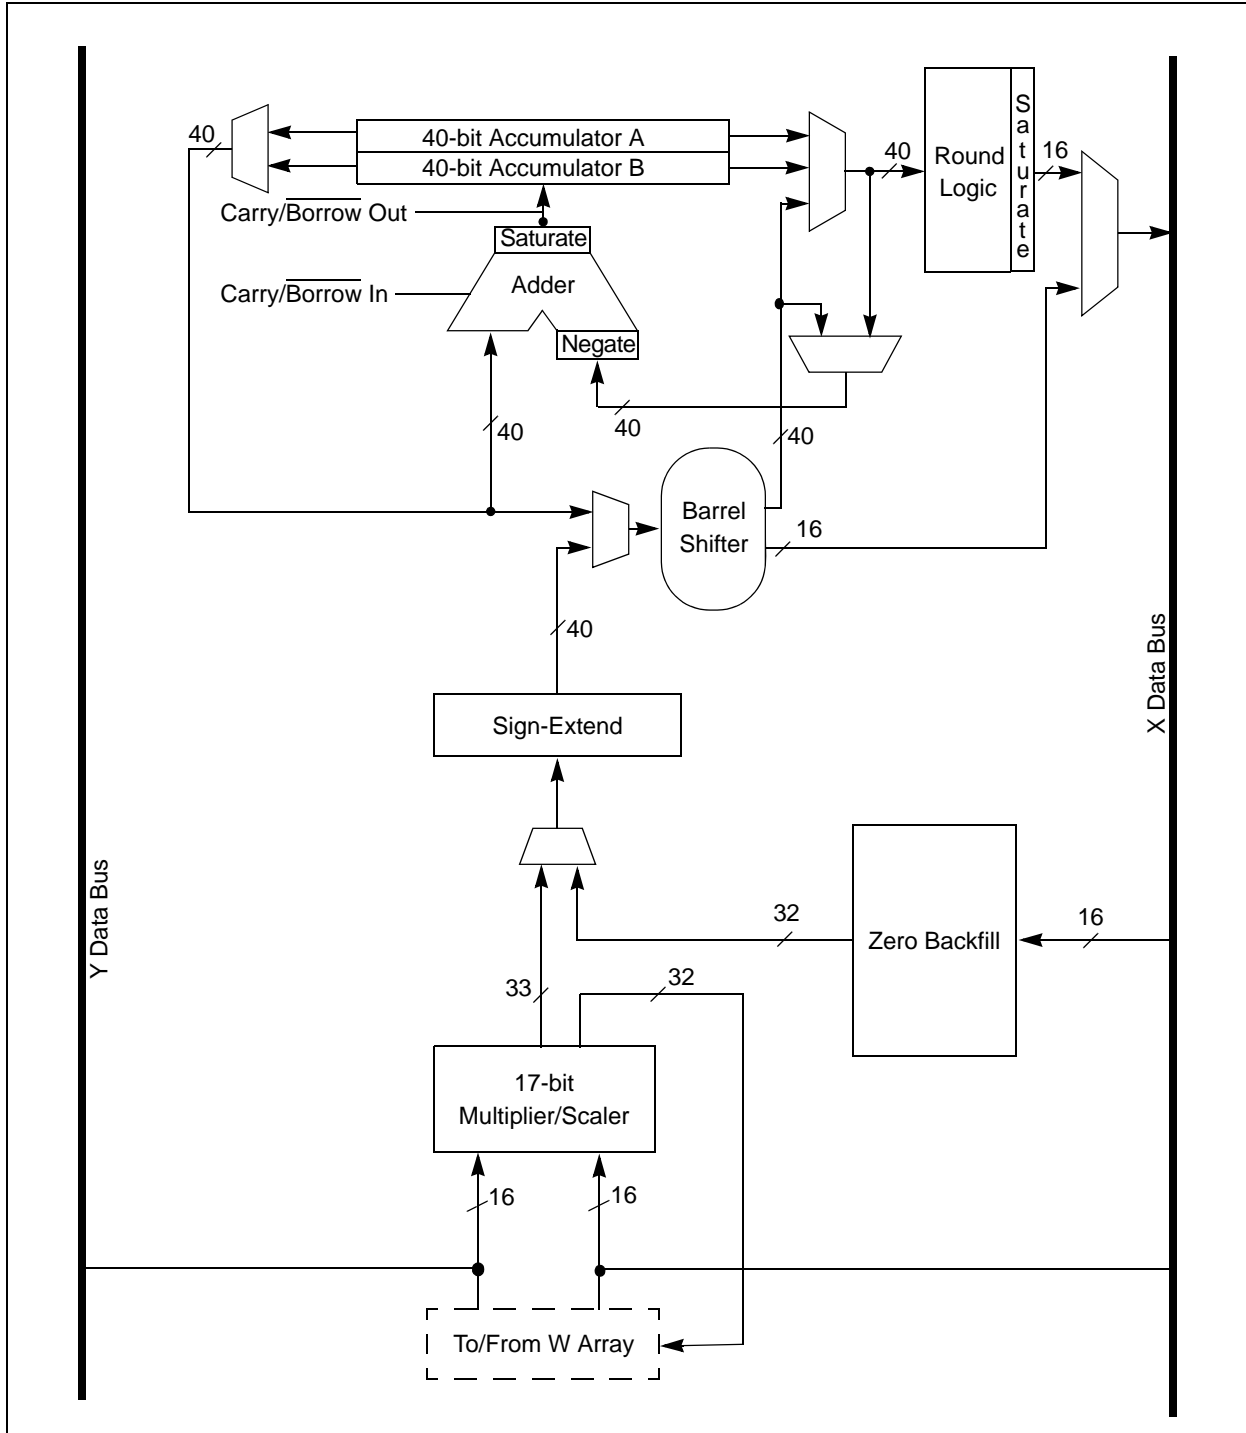

A block diagram of the DSP engine is shown in [Figure 3-3](#).

TABLE 3-1: DSP INSTRUCTIONS SUMMARY

| Instruction | Algebraic Operation | ACC Write Back |
|-------------|---------------------|----------------|
| CLR | $A = 0$ | Yes |
| ED | $A = (x - y)^2$ | No |
| EDAC | $A = A + (x - y)^2$ | No |
| MAC | $A = A + (x * y)$ | Yes |
| MAC | $A = A + x^2$ | No |
| MOVSAC | No change in A | Yes |
| MPY | $A = x \cdot y$ | No |
| MPY | $A = x^2$ | No |
| MPY.N | $A = -x \cdot y$ | No |
| MSC | $A = A - x \cdot y$ | Yes |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 3-3: DSP ENGINE BLOCK DIAGRAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

3.6.1 MULTIPLIER

The 17-bit x 17-bit multiplier is capable of signed or unsigned operation and can multiplex its output using a scaler to support either 1.31 fractional (Q31) or 32-bit integer results. Unsigned operands are zero-extended into the 17th bit of the multiplier input value. Signed operands are sign-extended into the 17th bit of the multiplier input value. The output of the 17-bit x 17-bit multiplier/scaler is a 33-bit value that is sign-extended to 40 bits. Integer data is inherently represented as a signed 2's complement value, where the Most Significant bit (MSb) is defined as a sign bit.

- The range of an N-bit 2's complement integer is -2^{N-1} to $2^{N-1} - 1$.
- For a 16-bit integer, the data range is -32768 (0x8000) to 32767 (0x7FFF) including '0'.
- For a 32-bit integer, the data range is -2,147,483,648 (0x8000 0000) to 2,147,483,647 (0x7FFF FFFF).

When the multiplier is configured for fractional multiplication, the data is represented as a 2's complement fraction, where the MSb is defined as a sign bit and the radix point is implied to lie just after the sign bit (QX format). The range of an N-bit 2's complement fraction with this implied radix point is -1.0 to $(1 - 2^{1-N})$. For a 16-bit fraction, the Q15 data range is -1.0 (0x8000) to 0.999969482 (0x7FFF) including '0' and has a precision of 3.01518×10^{-5} . In Fractional mode, the 16 x 16 multiply operation generates a 1.31 product that has a precision of 4.65661×10^{-10} .

The same multiplier is used to support the MCU multiply instructions which include integer 16-bit signed, unsigned and mixed sign multiply operations.

The MUL instruction can be directed to use byte or word sized operands. Byte operands will direct a 16-bit result, and word operands will direct a 32-bit result to the specified register(s) in the W array.

3.6.2 DATA ACCUMULATORS AND ADDER/SUBTRACTER

The data accumulator consists of a 40-bit adder/subtractor with automatic sign extension logic. It can select one of two accumulators (A or B) as its pre-accumulation source and post-accumulation destination. For the ADD and LAC instructions, the data to be accumulated or loaded can be optionally scaled using the barrel shifter prior to accumulation.

3.6.2.1 Adder/Subtractor, Overflow and Saturation

The adder/subtractor is a 40-bit adder with an optional zero input into one side, and either true or complement data into the other input.

- In the case of addition, the Carry/Borrow input is active-high and the other input is true data (not complemented).
- In the case of subtraction, the Carry/Borrow input is active-low and the other input is complemented.

The adder/subtractor generates Overflow Status bits, SA/SB and OA/OB, which are latched and reflected in the STATUS register:

- Overflow from bit 39: this is a catastrophic overflow in which the sign of the accumulator is destroyed.
- Overflow into guard bits 32 through 39: this is a recoverable overflow. This bit is set whenever all the guard bits are not identical to each other.

The adder has an additional saturation block that controls accumulator data saturation, if selected. It uses the result of the adder, the Overflow Status bits described previously and the SAT<A:B> (CORCON<7:6>) and ACCSAT (CORCON<4>) mode control bits to determine when and to what value to saturate.

Six STATUS register bits have been provided to support saturation and overflow:

- OA: AccA overflowed into guard bits
- OB: AccB overflowed into guard bits
- SA: AccA saturated (bit 31 overflow and saturation)
or
AccA overflowed into guard bits and saturated (bit 39 overflow and saturation)
- SB: AccB saturated (bit 31 overflow and saturation)
or
AccB overflowed into guard bits and saturated (bit 39 overflow and saturation)
- OAB: Logical OR of OA and OB
- SAB: Logical OR of SA and SB

The OA and OB bits are modified each time data passes through the adder/subtractor. When set, they indicate that the most recent operation has overflowed into the accumulator guard bits (bits 32 through 39). The OA and OB bits can also optionally generate an arithmetic warning trap when set and the corresponding Overflow Trap Flag Enable bits (OVATE, OVATE) in the INTCON1 register are set (refer to [Section 7.0 "Interrupt Controller"](#)). This allows the user application to take immediate action, for example, to correct system gain.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

The SA and SB bits are modified each time data passes through the adder/subtractor, but can only be cleared by the user application. When set, they indicate that the accumulator has overflowed its maximum range (bit 31 for 32-bit saturation or bit 39 for 40-bit saturation) and will be saturated (if saturation is enabled). When saturation is not enabled, SA and SB default to bit 39 overflow and thus indicate that a catastrophic overflow has occurred. If the COVTE bit in the INTCON1 register is set, SA and SB bits will generate an arithmetic warning trap when saturation is disabled.

The Overflow and Saturation Status bits can optionally be viewed in the STATUS Register (SR) as the logical OR of OA and OB (in bit OAB) and the logical OR of SA and SB (in bit SAB). Programs can check one bit in the STATUS register to determine if either accumulator has overflowed, or one bit to determine if either accumulator has saturated. This is useful for complex number arithmetic, which typically uses both accumulators.

The device supports three Saturation and Overflow modes:

- **Bit 39 Overflow and Saturation:**
When bit 39 overflow and saturation occurs, the saturation logic loads the maximally positive 9.31 (0x7FFFFFFF) or maximally negative 9.31 value (0x80000000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. This condition is referred to as 'super saturation' and provides protection against erroneous data or unexpected algorithm problems (such as gain calculations).
- **Bit 31 Overflow and Saturation:**
When bit 31 overflow and saturation occurs, the saturation logic then loads the maximally positive 1.31 value (0x007FFFFFFF) or maximally negative 1.31 value (0x00800000) into the target accumulator. The SA or SB bit is set and remains set until cleared by the user application. When this Saturation mode is in effect, the guard bits are not used, so the OA, OB or OAB bits are never set.
- **Bit 39 Catastrophic Overflow:**
The bit 39 Overflow Status bit from the adder is used to set the SA or SB bit, which remains set until cleared by the user application. No saturation operation is performed and the accumulator is allowed to overflow, destroying its sign. If the COVTE bit in the INTCON1 register is set, a catastrophic overflow can initiate a trap exception.

3.6.2.2 Accumulator 'Write Back'

The MAC class of instructions (with the exception of MPY, MPY.N, ED and EDAC) can optionally write a rounded version of the high word (bits 31 through 16) of the accumulator that is not targeted by the instruction

into data space memory. The write is performed across the X bus into combined X and Y address space. The following addressing modes are supported:

- **W13, Register Direct:**
The rounded contents of the non-target accumulator are written into W13 as a 1.15 fraction.
- **[W13]+ = 2, Register Indirect with Post-Increment:**
The rounded contents of the non-target accumulator are written into the address pointed to by W13 as a 1.15 fraction. W13 is then incremented by 2 (for a word write).

3.6.2.3 Round Logic

The round logic is a combinational block that performs a conventional (biased) or convergent (unbiased) round function during an accumulator write (store). The Round mode is determined by the state of the RND bit in the CORCON register. It generates a 16-bit, 1.15 data value that is passed to the data space write saturation logic. If rounding is not indicated by the instruction, a truncated 1.15 data value is stored and the least significant word (lsw) is simply discarded.

Conventional rounding zero-extends bit 15 of the accumulator and adds it to the ACCxH word (bits 16 through 31 of the accumulator).

- If the ACCxL word (bits 0 through 15 of the accumulator) is between 0x8000 and 0xFFFF (0x8000 included), ACCxH is incremented.
- If ACCxL is between 0x0000 and 0x7FFF, ACCxH is left unchanged.

A consequence of this algorithm is that over a succession of random rounding operations, the value tends to be biased slightly positive.

Convergent (or unbiased) rounding operates in the same manner as conventional rounding, except when ACCxL equals 0x8000. In this case, the Least Significant bit (bit 16 of the accumulator) of ACCxH is examined.

- If it is '1', ACCxH is incremented.
- If it is '0', ACCxH is not modified. Assuming that bit 16 is effectively random in nature, this scheme removes any rounding bias that may accumulate.

The SAC and SAC.R instructions store either a truncated (SAC), or rounded (SAC.R) version of the contents of the target accumulator to data memory via the X bus, subject to data saturation (see [Section 3.6.2.4 "Data Space Write Saturation"](#)). For the MAC class of instructions, the accumulator write-back operation functions in the same manner, addressing combined MCU (X and Y) data space though the X bus. For this class of instructions, the data is always subject to rounding.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

3.6.2.4 Data Space Write Saturation

In addition to adder/subtractor saturation, writes to data space can also be saturated but without affecting the contents of the source accumulator. The data space write saturation logic block accepts a 16-bit, 1.15 fractional value from the round logic block as its input, together with overflow status from the original source (accumulator) and the 16-bit round adder. These inputs are combined and used to select the appropriate 1.15 fractional value as output to write to data space memory.

If the SATDW bit in the CORCON register is set, data (after rounding or truncation) is tested for overflow and adjusted accordingly:

- For input data greater than 0x007FFF, data written to memory is forced to the maximum positive 1.15 value, 0x7FFF.
- For input data less than 0xFF8000, data written to memory is forced to the maximum negative 1.15 value, 0x8000.

The Most significant bit of the source (bit 39) is used to determine the sign of the operand being tested.

If the SATDW bit in the CORCON register is not set, the input data is always passed through unmodified under all conditions.

3.6.3 BARREL SHIFTER

The barrel shifter can perform up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts in a single cycle. The source can be either of the two DSP accumulators or the X bus (to support multi-bit shifts of register or memory data).

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

The barrel shifter is 40 bits wide, thereby obtaining a 40-bit result for DSP shift operations and a 16-bit result for MCU shift operations. Data from the X bus is presented to the barrel shifter between bit positions 16 and 31 for right shifts, and between bit positions 0 and 16 for left shifts.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 4. “Program Memory”** (DS70202) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

4.1 Program Address Space

The program address memory space of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in **Section 4.6 “Interfacing Program and Data Memory Spaces”**.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The memory maps for the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices are shown in **Figure 4-1**.

FIGURE 4-1: PROGRAM MEMORY FOR dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 DEVICES

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 4-2).

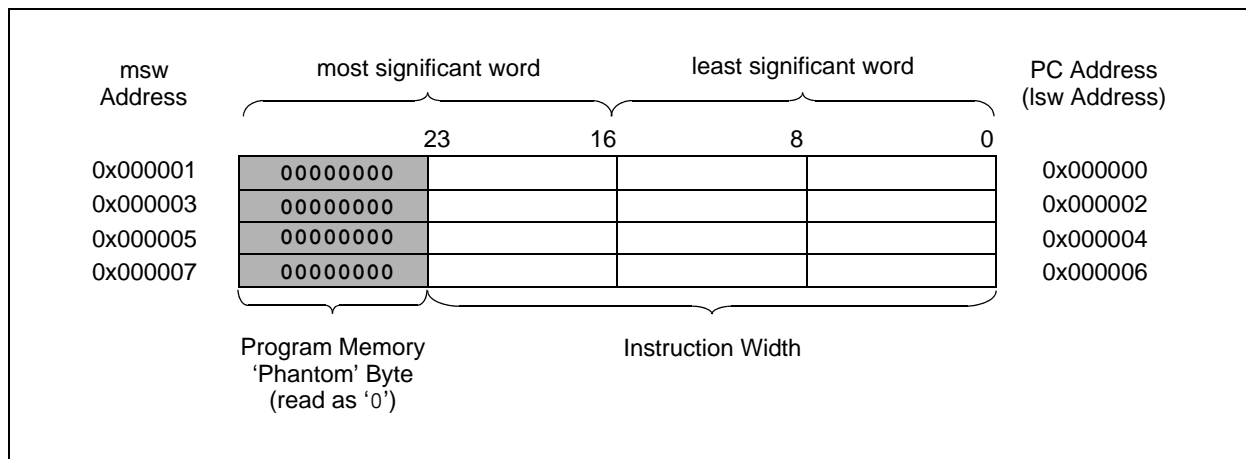

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement provides compatibility with data memory space addressing and makes data in the program memory space accessible.

4.1.2 INTERRUPT AND TRAP VECTORS

All dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user application at 0x000000, with the actual address for the start of code at 0x000002.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices also have two interrupt vector tables, located from 0x000004 to 0x0000FF and 0x000100 to 0x0001FF. These vector tables allow each of the many device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the interrupt vector tables is provided in [Section 7.1 "Interrupt Vector Table"](#).

FIGURE 4-2: PROGRAM MEMORY ORGANIZATION

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.2 Data Address Space

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 CPU has a separate 16-bit wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. The data memory maps is shown in [Figure 4-3](#).

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when $EA_{\langle 15 \rangle} = 0$) is used for implemented memory addresses, while the upper half ($EA_{\langle 15 \rangle} = 1$) is reserved for the Program Space Visibility area (see [Section 4.6.3 “Reading Data from Program Memory Using Program Space Visibility”](#)).

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices implement up to 2 Kbytes of data memory. Should an EA point to a location outside of this area, an all-zero word or byte will be returned.

4.2.1 DATA SPACE WIDTH

The data memory space is organized in byte addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes (LSBs) of each word have even addresses, while the Most Significant Bytes (MSBs) have odd addresses.

4.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PIC[®] MCU devices and improve data space memory usage efficiency, the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 instruction set supports both word and byte operations. As a consequence of byte accessibility, all effective address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of $Ws + 1$ for byte operations and $Ws + 2$ for word operations.

Data byte reads will read the complete word that contains the byte, using the LSB of any EA to determine which byte to select. The selected byte is placed onto the LSB of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register that matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed. If the instruction occurred on a write, the instruction is executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user application to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte is not modified.

A sign-extend instruction (SE) is provided to allow users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, user applications can clear the MSB of any W register by executing a zero-extend (ZE) instruction on the appropriate address.

4.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'. A complete listing of implemented SFRs, including their addresses, is shown in [Table 4-1](#) through [Table 4-22](#).

| |
|---|
| Note: The actual set of peripheral features and interrupts varies by the device. Refer to the corresponding device tables and pinout diagrams for device-specific information. |
|---|

4.2.4 NEAR DATA SPACE

The 8 Kbyte area between 0x0000 and 0x1FFF is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MOV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a working register as an address pointer.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 4-3: DATA MEMORY MAP FOR dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 DEVICES WITH 2 KB RAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.2.5 X AND Y DATA SPACES

The core has two data spaces, X and Y. These data spaces can be considered either separate (for some DSP instructions), or as one unified linear address range (for MCU instructions). The data spaces are accessed using two Address Generation Units (AGUs) and separate data paths. This feature allows certain instructions to concurrently fetch two words from RAM, thereby enabling efficient execution of DSP algorithms such as Finite Impulse Response (FIR) filtering and Fast Fourier Transform (FFT).

The X data space is used by all instructions and supports all addressing modes. X data space has separate read and write data buses. The X read data bus is the read data path for all instructions that view data space as combined X and Y address space. It is also the X data prefetch path for the dual operand DSP instructions (MAC class).

The Y data space is used in concert with the X data space by the MAC class of instructions (CLR, ED, EDAC, MAC, MOVSA, MPY, MPY.N and MSC) to provide two concurrent data read paths.

Both the X and Y data spaces support Modulo Addressing mode for all instructions, subject to addressing mode restrictions. Bit-Reversed Addressing mode is only supported for writes to X data space.

All data memory writes, including in DSP instructions, view data space as combined X and Y address space. The boundary between the X and Y data spaces is device-dependent and is not user-programmable.

All effective addresses are 16 bits wide and point to bytes within the data space. Therefore, the data space address range is 64 Kbytes, or 32K words, though the implemented memory locations vary by device.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.2.6 SOFTWARE STACK

In addition to its use as a working register, the W15 register in the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices is also used as a software Stack Pointer. The Stack Pointer always points to the first available free word and grows from lower to higher addresses. It pre-decrements for stack pops and post-increments for stack pushes, as shown in Figure 4-4. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

Note: A PC push during exception processing concatenates the SRL register to the MSB of the PC prior to the push.

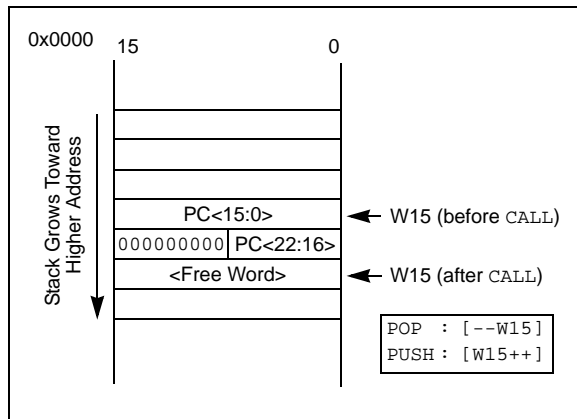

The Stack Pointer Limit register (SPLIM) associated with the Stack Pointer sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' because all stack operations must be word-aligned.

When an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation. For example, to cause a stack error trap when the stack grows beyond address 0x1000 in RAM, initialize the SPLIM with the value 0x0FFE.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0x0800. This prevents the stack from interfering with the Special Function Register (SFR) space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 4-4: CALL STACK FRAME

4.2.7 DATA RAM PROTECTION FEATURE

The dsPIC33F product family supports Data RAM protection features that enable segments of RAM to be protected when used in conjunction with Boot and Secure Code Segment Security. BSRAM (Secure RAM segment for Boot Segment) is accessible only from the Boot Segment Flash code when enabled. SSRAM (Secure RAM segment for RAM) is accessible only from the Secure Segment Flash code when enabled. See Table 4-1 for an overview of the BSRAM and SSRAM SFRs.

4.3 Instruction Addressing Modes

The addressing modes shown in Table 4-23 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions differ from those in the other instruction types.

4.3.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire data space.

4.3.2 MCU INSTRUCTIONS

The three-operand MCU instructions are of the form:

Operand 3 = Operand 1 <function> Operand 2

where:

Operand 1 is always a working register (that is, the addressing mode can only be register direct), which is referred to as Wb.

Operand 2 can be a W register, fetched from data memory, or a 5-bit literal.

The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-bit or 10-bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions can support different subsets of these addressing modes.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 4-23: FUNDAMENTAL ADDRESSING MODES SUPPORTED

| Addressing Mode | Description |
|---|--|
| File Register Direct | The address of the file register is specified explicitly. |
| Register Direct | The contents of a register are accessed directly. |
| Register Indirect | The contents of Wn forms the Effective Address (EA.) |
| Register Indirect Post-Modified | The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA. |
| Register Indirect with Register Offset (Register Indexed) | The sum of Wn and Wb forms the EA. |
| Register Indirect with Literal Offset | The sum of Wn and a literal forms the EA. |

4.3.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater degree of addressing flexibility than other instructions. In addition to the Addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-bit Literal
- 16-bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.3.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOV SAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the data pointers through register indirect tables.

The two-source operand prefetch registers must be members of the set {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The effective addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.3.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ADD ACC, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.4 Modulo Addressing

Modulo Addressing mode is a method of providing an automated means to support circular data buffers using hardware. The objective is to remove the need for software to perform data address boundary checks when executing tightly looped code, as is typical in many DSP algorithms.

Modulo Addressing can operate in either data or program space (since the data pointer mechanism is essentially the same for both). One circular buffer can be supported in each of the X (which also provides the pointers into program space) and Y data spaces. Modulo Addressing can operate on any W register pointer. However, it is not advisable to use W14 or W15 for Modulo Addressing since these two registers are used as the Stack Frame Pointer and Stack Pointer, respectively.

In general, any particular circular buffer can be configured to operate in only one direction, as there are certain restrictions on the buffer start address (for incrementing buffers), or end address (for decrementing buffers), based upon the direction of the buffer.

The only exception to the usage restrictions is for buffers that have a power-of-two length. As these buffers satisfy the start and end address criteria, they can operate in a bidirectional mode (that is, address boundary checks are performed on both the lower and upper address boundaries).

4.4.1 START AND END ADDRESS

The Modulo Addressing scheme requires that a starting and ending address be specified and loaded into the 16-bit Modulo Buffer Address registers: XMODSRT, XMODEND, YMODSRT and YMODEND (see Table 4-1).

Note: Y space Modulo Addressing EA calculations assume word sized data (LSB of every EA is always clear).

The length of a circular buffer is not directly specified. It is determined by the difference between the corresponding start and end addresses. The maximum possible length of the circular buffer is 32K words (64 Kbytes).

4.4.2 W ADDRESS REGISTER SELECTION

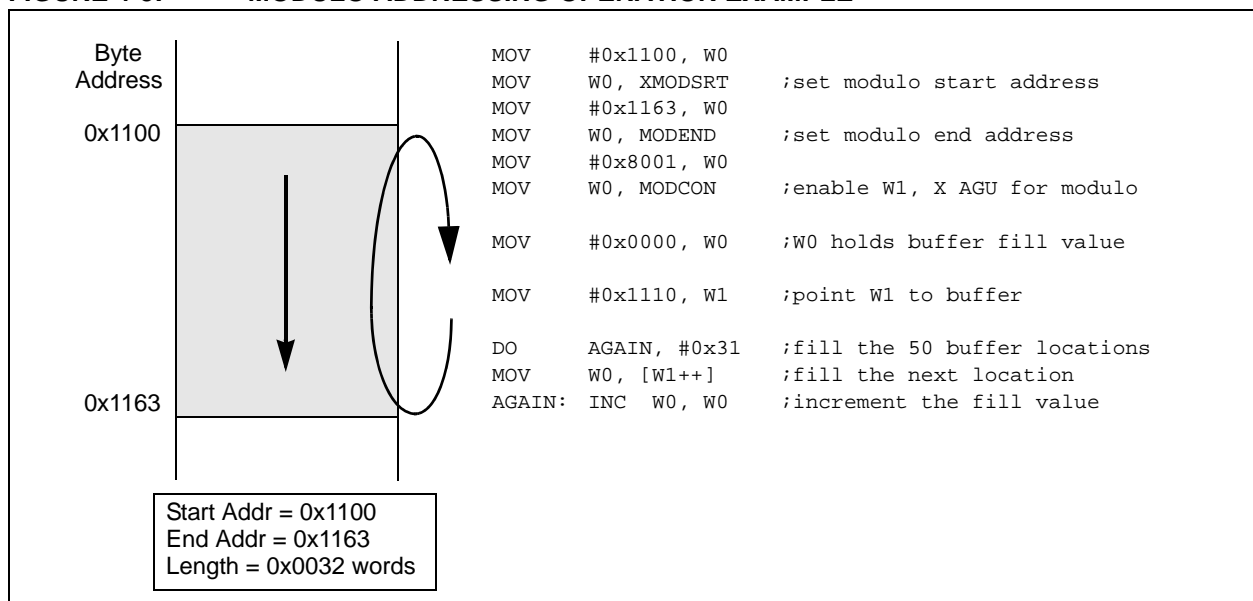

The Modulo and Bit-Reversed Addressing Control register, MODCON<15:0>, contains enable flags as well as a W register field to specify the W Address registers. The XWM and YWM fields select the registers that will operate with Modulo Addressing:

- If XWM = 15, X RAGU and X WAGU Modulo Addressing is disabled.
- If YWM = 15, Y AGU Modulo Addressing is disabled.

The X Address Space Pointer W register (XWM), to which Modulo Addressing is to be applied, is stored in MODCON<3:0> (see Table 4-1). Modulo Addressing is enabled for X data space when XWM is set to any value other than '15' and the XMODEN bit is set at MODCON<15>.

The Y Address Space Pointer W register (YWM) to which Modulo Addressing is to be applied is stored in MODCON<7:4>. Modulo Addressing is enabled for Y data space when YWM is set to any value other than '15' and the YMODEN bit is set at MODCON<14>.

FIGURE 4-5: MODULO ADDRESSING OPERATION EXAMPLE

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.4.3 MODULO ADDRESSING APPLICABILITY

Modulo Addressing can be applied to the Effective Address (EA) calculation associated with any W register.

Address boundaries check for addresses equal to:

- The upper boundary addresses for incrementing buffers
- The lower boundary addresses for decrementing buffers

It is important to realize that the address boundaries also check for addresses less than or greater than these addresses. Address changes can, therefore, jump beyond boundaries and still be adjusted correctly.

Note: The modulo corrected effective address is written back to the register only when Pre-Modify or Post-Modify Addressing mode is used to compute the effective address. When an address offset (such as [W7+W2]) is used, Modulo Address correction is performed but the contents of the register remain unchanged.

4.5 Bit-Reversed Addressing

Bit-Reversed Addressing mode is intended to simplify data re-ordering for radix-2 FFT algorithms. It is supported by the X AGU for data writes only.

The modifier, which can be a constant value or register contents, is regarded as having its bit order reversed. The address source and destination are kept in normal order. Thus, the only operand requiring reversal is the modifier.

4.5.1 BIT-REVERSED ADDRESSING IMPLEMENTATION

Bit-Reversed Addressing mode is enabled in any of these situations:

- BWM bits (W register selection) in the MODCON register are any value other than '15' (the stack cannot be accessed using Bit-Reversed Addressing).
- The BREN bit is set in the XBREV register.
- The addressing mode used is Register Indirect with Pre-Increment or Post-Increment.

If the length of a bit-reversed buffer is $M = 2^N$ bytes, the last 'N' bits of the data buffer start address must be zeros.

XB<14:0> is the Bit-Reversed Address modifier, or 'pivot point', which is typically a constant. In the case of an FFT computation, its value is equal to half of the FFT data buffer size.

Note: All bit-reversed EA calculations assume word sized data (LSB of every EA is always clear). The XB value is scaled accordingly to generate compatible (byte) addresses.

When enabled, Bit-Reversed Addressing is executed only for Register Indirect with Pre-Increment or Post-Increment Addressing and word sized data writes. It will not function for any other addressing mode or for byte sized data, and normal addresses are generated instead. When Bit-Reversed Addressing is active, the W Address Pointer is always added to the address modifier (XB), and the offset associated with the Register Indirect Addressing mode is ignored. In addition, as word sized data is a requirement, the LSB of the EA is ignored (and always clear).

Note: Modulo Addressing and Bit-Reversed Addressing should not be enabled together. If an application attempts to do so, Bit-Reversed Addressing will assume priority when active for the X WAGU and X WAGU Modulo Addressing will be disabled. However, Modulo Addressing will continue to function in the X RAGU.

If Bit-Reversed Addressing has already been enabled by setting the BREN bit (XBREV<15>), a write to the XBREV register should not be immediately followed by an indirect read operation using the W register that has been designated as the bit-reversed pointer.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.6 Interfacing Program and Data Memory Spaces

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 architecture uses a 24-bit wide program space and a 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated periodically. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look ups from a large table of static data. The application can only access the least significant word of the program word.

4.6.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Page register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

For remapping operations, the 8-bit Program Space Visibility register (PSVPAG) is used to define a 16K word page in the program space. When the Most Significant bit of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike table operations, this limits remapping operations strictly to the user memory area.

Table 4-25 and Figure 4-7 show how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> refers to a program space word, and D<15:0> refers to a data space word.

TABLE 4-25: PROGRAM SPACE ADDRESS CONSTRUCTION

| Access Type | Access Space | Program Space Address | | | | |
|--|---------------|-------------------------------|-------------------------------|---------------|------------------------------|-----|
| | | <23> | <22:16> | <15> | <14:1> | <0> |

FIGURE 4-7: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.6.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program space without going through data space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit wide word address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space that contains the least significant data word. TBLRDH and TBLWTH access the space that contains the upper data byte.

Two table instructions are provided to move byte or word sized (16-bit) data to and from program space. Both function as either byte or word operations.

- TBLRDL (Table Read Low): In Word mode, this instruction maps the lower word of the program space location ($P<15:0>$) to a data address ($D<15:0>$).

In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.

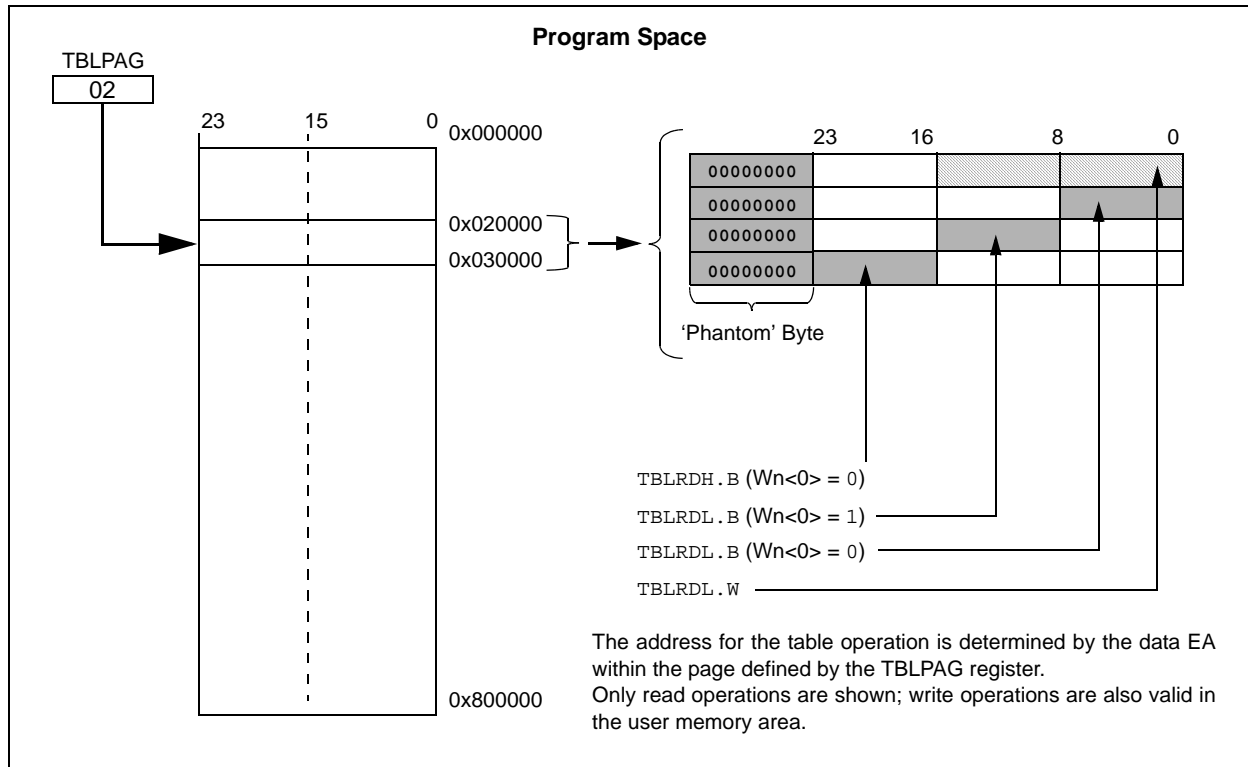

- TBLRDH (Table Read High): In Word mode, this instruction maps the entire upper word of a program address ($P<23:16>$) to a data address. Note that $D<15:8>$, the 'phantom byte', will always be '0'.

In Byte mode, this instruction maps the upper or lower byte of the program word to $D<7:0>$ of the data address, as in the TBLRDL instruction. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in [Section 5.0 "Flash Program Memory"](#).

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When $TBLPAG<7> = 0$, the table page is located in the user memory space. When $TBLPAG<7> = 1$, the page is located in configuration space.

FIGURE 4-8: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

4.6.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as `TBLRDH`).

Program space access through the data space occurs if the Most Significant bit of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (`CORCON<2>`). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (`PSVPAG`). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, `PSVPAG` functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address 8000h and higher maps directly into a corresponding program memory address (see [Figure 4-9](#)), only the lower 16 bits of the

24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a `NOOP`. This prevents possible issues should the area of code ever be accidentally executed.

Note: PSV access is temporarily disabled during table reads/writes.

For operations that use PSV and are executed outside a `REPEAT` loop, the `MOV` and `MOV.D` instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV, and are executed inside a `REPEAT` loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the `REPEAT` loop will allow the instruction using PSV to access data to execute in a single cycle.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

5.0 FLASH PROGRAM MEMORY

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 5. “Flash Programming”** (DS70191) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- Run-Time Self-Programming (RTSP)

ICSP allows a dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 device to be serially programmed while in the end application circuit. This is done with two lines for programming clock and programming data (one of the alternate programming pin pairs: PGECx/PGEDx), and three other lines for power (VDD),

ground (Vss) and Master Clear ($\overline{\text{MCLR}}$). This allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user application can write program memory data either in blocks or ‘rows’ of 64 instructions (192 bytes) at a time or a single program memory word, and erase program memory in blocks or ‘pages’ of 512 instructions (1536 bytes) at a time.

5.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits <7:0> of the TBLPAG register and the Effective Address (EA) from a W register specified in the table instruction, as shown in [Figure 5-1](#).

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

5.2 RTSP Operation

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (512 instructions) at a time, and to program one row or one word at a time. The 8-row erase pages and single row write rows are edge-aligned from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

The program memory implements holding buffers that can contain 64 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers sequentially. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 64 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the table write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

The programming time depends on the FRC accuracy (see Table 22-18) and the value of the FRC Oscillator Tuning register (see Register 8-4). Use the following formula to calculate the minimum and maximum values for the Row Write Time, Page Erase Time, and Word Write Cycle Time parameters (see Table 22-12).

EQUATION 5-1: PROGRAMMING TIME

$$T = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (\text{FRC Accuracy})\% \times (\text{FRC Tuning})\%}$$

For example, if the device is operating at +125°C, the FRC accuracy will be ±5%. If the TUN<5:0> bits (see Register 8-4) are set to `b1111111, the minimum row write time is equal to Equation 5-2.

EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 + 0.05) \times (1 - 0.00375)} = 1.435 \text{ ms}$$

The maximum row write time is equal to Equation 5-3.

EQUATION 5-3: MAXIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064 \text{ Cycles}}{7.37 \text{ MHz} \times (1 - 0.05) \times (1 - 0.00375)} = 1.586 \text{ ms}$$

Setting the WR bit (NVMCON<15>) starts the operation, and the WR bit is automatically cleared when the operation is finished.

5.4 Control Registers

The two SFRs that are used to read and write the program Flash memory are:

- **NVMCON: Flash Memory Control Register**
- **NVMKEY: Nonvolatile Memory Key Register**

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY (Register 5-2) is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. Refer to Section 5.3 “Programming Operations” for further details.

5.4.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

Programmers can program one row of program Flash memory at a time. To do this, it is necessary to erase the 8-row erase page that contains the desired row. The general process is:

1. Read eight rows of program memory (512 instructions) and store in data RAM.
2. Update the program data in RAM with the desired new data.
3. Erase the block (see [Example 5-1](#)):
 - a) Set the NVMOP bits (NVMCON<3:0>) to '0010' to configure for block erase. Set the ERASE bit (NVMCON<6>) and the WREN bit (NVMCON<14>).
 - b) Write the starting address of the page to be erased into the TBLPAG and W registers.
 - c) Write 0x55 to NVMKEY.
 - d) Write 0xAA to NVMKEY.
 - e) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.
4. Write the first 64 instructions from data RAM into the program memory buffers (see [Example 5-2](#)).
5. Write the program block to Flash memory:
 - a) Set the NVMOP bits to '0001' to configure for row programming. Clear the ERASE bit and set the WREN bit.
 - b) Write 0x55 to NVMKEY.
 - c) Write 0xAA to NVMKEY.
 - d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.
6. Repeat steps 4 and 5, using the next available 64 instructions from the block in data RAM by incrementing the value in TBLPAG, until all 512 instructions are written back to Flash memory.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user application must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPs, as shown in [Example 5-3](#).

EXAMPLE 5-1: ERASING A PROGRAM MEMORY PAGE

```
; Set up NVMCON for block erase operation
MOV    #0x4042, W0                ;
MOV    W0, NVMCON                ; Initialize NVMCON
; Init pointer to row to be ERASED
MOV    #tblpage(PROG_ADDR), W0   ;
MOV    W0, TBLPAG                ; Initialize PM Page Boundary SFR
MOV    #tbloffset(PROG_ADDR), W0 ; Initialize in-page EA[15:0] pointer
TBLWTL W0, [W0]                  ; Set base address of erase block
DISI   #5                        ; Block all interrupts with priority <7
                                           ; for next 5 instructions

MOV    #0x55, W0
MOV    W0, NVMKEY                ; Write the 55 key
MOV    #0xAA, W1
MOV    W1, NVMKEY                ; Write the AA key
BSET   NVMCON, #WR               ; Start the erase sequence
NOP                                         ; Insert two NOPs after the erase
NOP                                         ; command is asserted
```

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

EXAMPLE 5-2: LOADING THE WRITE BUFFERS

```
; Set up NVMCON for row programming operations
MOV    #0x4001, W0          ;
MOV    W0, NVMCON          ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
MOV    #0x0000, W0          ;
MOV    W0, TBLPAG          ; Initialize PM Page Boundary SFR
MOV    #0x6000, W0          ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
MOV    #LOW_WORD_0, W2      ;
MOV    #HIGH_BYTE_0, W3     ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
; 1st_program_word
MOV    #LOW_WORD_1, W2      ;
MOV    #HIGH_BYTE_1, W3     ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
; 2nd_program_word
MOV    #LOW_WORD_2, W2      ;
MOV    #HIGH_BYTE_2, W3     ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
.
.
.
; 63rd_program_word
MOV    #LOW_WORD_31, W2     ;
MOV    #HIGH_BYTE_31, W3    ;
TBLWTL W2, [W0]             ; Write PM low word into program latch
TBLWTH W3, [W0++]          ; Write PM high byte into program latch
```

EXAMPLE 5-3: INITIATING A PROGRAMMING SEQUENCE

```
DISI   #5                    ; Block all interrupts with priority <7
                                   ; for next 5 instructions
MOV    #0x55, W0              ;
MOV    W0, NVMKEY             ; Write the 55 key
MOV    #0xAA, W1              ;
MOV    W1, NVMKEY             ; Write the AA key
BSET   NVMCON, #WR            ; Start the erase sequence
NOP    ; Insert two NOPs after the
NOP    ; erase command is asserted
```

6.0 RESETS

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. “Reset”** (DS70192) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Reset module combines all reset sources and controls the device Master Reset Signal, $\overline{\text{SYSRST}}$. The following is a list of device Reset sources:

- POR: Power-on Reset
- BOR: Brown-out Reset
- $\overline{\text{MCLR}}$: Master Clear Pin Reset
- SWR: RESET Instruction
- WDTO: Watchdog Timer Reset
- CM: Configuration Mismatch Reset
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Condition Device Reset
 - Illegal Opcode Reset
 - Uninitialized W Register Reset
 - Security Reset

A simplified block diagram of the Reset module is shown in [Figure 6-1](#).

Any active source of reset will make the $\overline{\text{SYSRST}}$ signal active. On system Reset, some of the registers associated with the CPU and peripherals are forced to a known Reset state and some are unaffected.

Note: Refer to the specific peripheral section or **Section 3.0 “CPU”** of this manual for register Reset states.

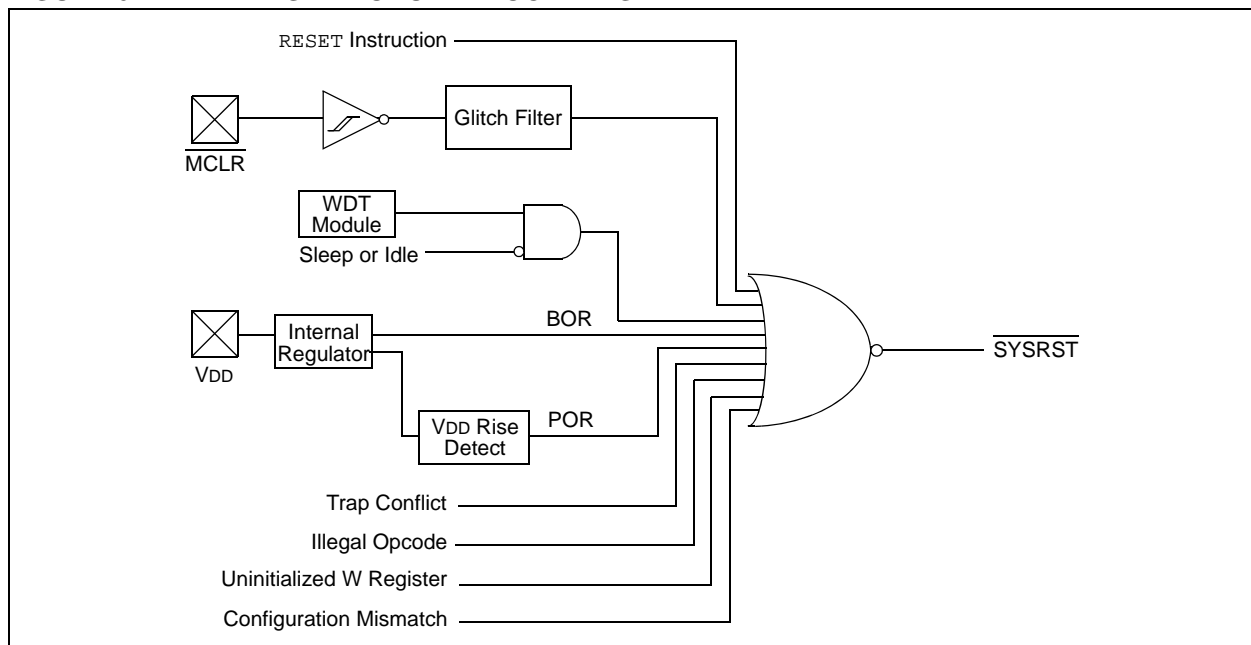

All types of device Reset sets a corresponding status bit in the RCON register to indicate the type of Reset (see [Register 6-1](#)).

A POR clears all the bits, except for the POR bit (RCON<0>), that are set. The user application can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset is meaningful.

FIGURE 6-1: RESET MODULE BLOCK DIAGRAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

REGISTER 6-1: RCON: RESET CONTROL REGISTER⁽¹⁾ (CONTINUED)

| | |
|-------|--|
| bit 1 | BOR: Brown-out Reset Flag bit 1 = A Brown-out Reset has occurred 0 = A Brown-out Reset has not occurred |
| bit 0 | POR: Power-on Reset Flag bit 1 = A Power-on Reset has occurred 0 = A Power-on Reset has not occurred |

Note 1: All of the Reset status bits can be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

6.1 System Reset

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices have two types of Reset:

- Cold Reset
- Warm Reset

A cold Reset is the result of a Power-on Reset (POR) or a Brown-out Reset (BOR). On a cold Reset, the FNOSC configuration bits in the FOSC device configuration register selects the device clock source.

A warm Reset is the result of all other reset sources, including the RESET instruction. On warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection bits (COSC<2:0>) in the Oscillator Control register (OSCCON<14:12>).

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is detailed below and is shown in [Figure 6-2](#).

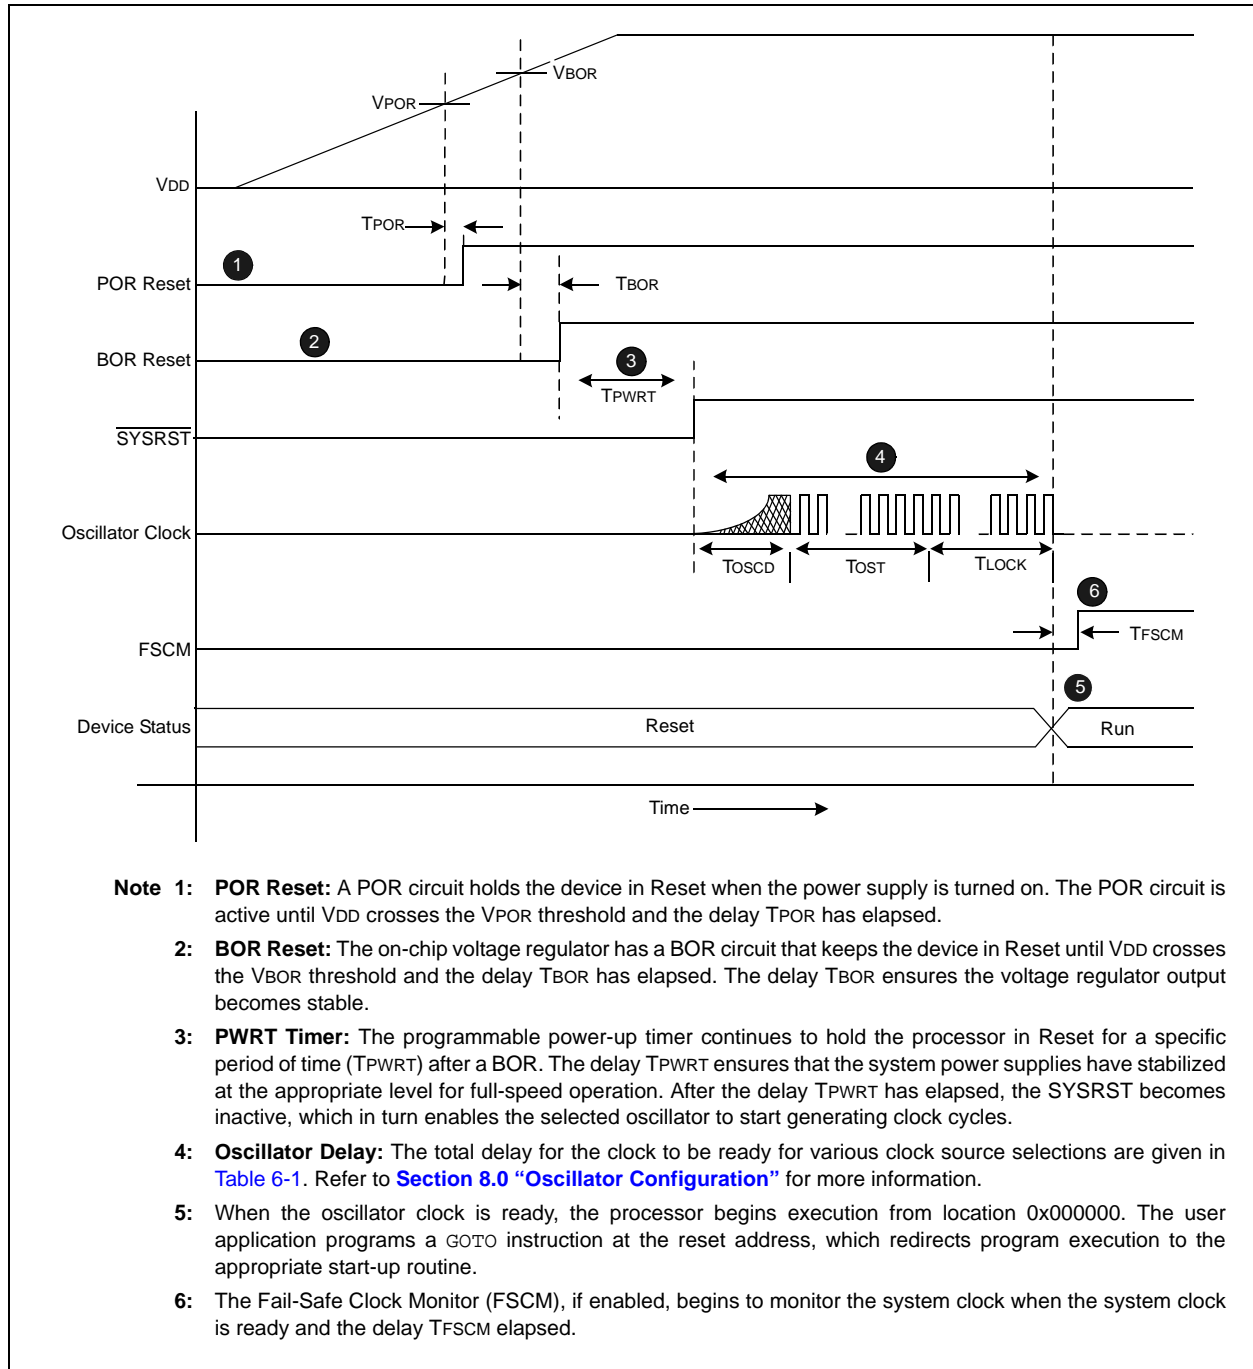

TABLE 6-1: OSCILLATOR DELAY

| Oscillator Mode | Oscillator Start-up Delay | Oscillator Start-up Timer | PLL Lock Time | Total Delay |
|------------------------|---------------------------|---------------------------|---------------|----------------------|
| FRC, FRCDIV16, FRCDIVN | TOSCD | — | — | TOSCD |
| FRCPLL | TOSCD | — | TLOCK | TOSCD + TLOCK |
| XT | TOSCD | TOST | — | TOSCD + TOST |
| HS | TOSCD | TOST | — | TOSCD + TOST |
| EC | — | — | — | — |
| XTPLL | TOSCD | TOST | TLOCK | TOSCD + TOST + TLOCK |
| HSPLL | TOSCD | TOST | TLOCK | TOSCD + TOST + TLOCK |
| ECPLL | — | — | TLOCK | TLOCK |
| SOSC | TOSCD | TOST | — | TOSCD + TOST |
| LPRC | TOSCD | — | — | TOSCD |

- Note 1:** TOSCD = Oscillator Start-up Delay (1.1 μ s max for FRC, 70 μ s max for LPRC). Crystal Oscillator start-up times vary with crystal characteristics, load capacitance, etc.
- 2:** TOST = Oscillator Start-up Timer Delay (1024 oscillator clock period). For example, TOST = 102.4 μ s for a 10 MHz crystal and TOST = 32 ms for a 32 kHz crystal.
- 3:** TLOCK = PLL lock time (1.5 ms nominal), if PLL is enabled.

| Symbol | Parameter | Value |
|--------|----------------------------------|---------------------|
| VPOR | POR threshold | 1.8V nominal |
| TPOR | POR extension time | 30 μ s maximum |
| VBOR | BOR threshold | 2.5V nominal |
| TBOR | BOR extension time | 100 μ s maximum |
| TPWRT | Programmable power-up time delay | 0-128 ms nominal |
| TFSCM | Fail-Safe Clock Monitor Delay | 900 μ s maximum |

Note: When the device exits the Reset condition (begins normal operation), the device operating parameters (voltage, frequency, temperature, etc.) must be within their operating ranges, otherwise the device may not function correctly. The user application must ensure that the delay between the time power is first applied, and the time $\overline{\text{SYSRST}}$ becomes inactive, is long enough to get all operating parameters within specification.

6.2 Power-on Reset (POR)

A Power-on Reset (POR) circuit ensures the device is reset from power-on. The POR circuit is active until VDD crosses the VPOR threshold and the delay TPOR has elapsed. The delay TPOR ensures the internal device bias circuits become stable.

The device supply voltage characteristics must meet the specified starting voltage and rise rate requirements to generate the POR. Refer to [Section 22.0 “Electrical Characteristics”](#) for details.

The POR status (POR) bit in the Reset Control (RCON<0>) register is set to indicate the Power-on Reset.

6.2.1 Brown-out Reset (BOR) and Power-up timer (PWRT)

The on-chip regulator has a Brown-out Reset (BOR) circuit that resets the device when the VDD is too low ($V_{DD} < V_{BOR}$) for proper device operation. The BOR circuit keeps the device in Reset until VDD crosses VBOR threshold and the delay TBOR has elapsed. The delay TBOR ensures the voltage regulator output becomes stable.

The BOR status bit in the Reset Control register (RCON<1>) is set to indicate the Brown-out Reset.

The device will not run at full speed after a BOR as the VDD should rise to acceptable levels for full-speed operation. The PWRT provides power-up time delay (TPWRT) to ensure that the system power supplies have stabilized at the appropriate levels for full-speed operation before the $\overline{\text{SYSRST}}$ is released.

The power-up timer delay (TPWRT) is programmed by the Power-on Reset Timer Value Select bits (FPWRT<2:0>) in the POR Configuration register (FPOR<2:0>), which provide eight settings (from 0 ms to 128 ms). Refer to [Section 19.0 “Special Features”](#) for further details.

[Figure 6-3](#) shows the typical brown-out scenarios. The reset delay (TBOR + TPWRT) is initiated each time VDD rises above the VBOR trip point

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 6-3: BROWN-OUT SITUATIONS

6.3 External Reset (EXTR)

The external Reset is generated by driving the $\overline{\text{MCLR}}$ pin low. The $\overline{\text{MCLR}}$ pin is a Schmitt trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse-width will generate a Reset. Refer to [Section 22.0 “Electrical Characteristics”](#) for minimum pulse-width specifications. The External Reset ($\overline{\text{MCLR}}$) Pin (EXTR) bit in the Reset Control (RCON) register is set to indicate the $\overline{\text{MCLR}}$ Reset.

6.3.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate reset signals to Reset multiple devices in the system. This external Reset signal can be directly connected to the $\overline{\text{MCLR}}$ pin to Reset the device when the rest of system is Reset.

6.3.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to Reset the device, the external reset pin ($\overline{\text{MCLR}}$) should be tied directly or resistively to VDD. In this case, the $\overline{\text{MCLR}}$ pin will not be used to generate a Reset. The external reset pin ($\overline{\text{MCLR}}$) does not have an internal pull-up and must not be left unconnected.

6.4 Software RESET Instruction (SWR)

Whenever the `RESET` instruction is executed, the device will assert $\overline{\text{SYSRST}}$, placing the device in a special Reset state. This Reset state will not re-initialize the clock. The clock source in effect prior to the `RESET` instruction will remain. $\overline{\text{SYSRST}}$ is released at the next instruction cycle, and the reset vector fetch will commence.

The Software Reset (Instruction) Flag bit (SWR) in the Reset Control register (RCON<6>) is set to indicate the software Reset.

6.5 Watchdog Time-out Reset (WDTO)

Whenever a Watchdog time-out occurs, the device will asynchronously assert $\overline{\text{SYSRST}}$. The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out Flag (WDTO) bit in the Reset Control register (RCON<4>) is set to indicate the Watchdog Reset. Refer to [Section 19.4 “Watchdog Timer \(WDT\)”](#) for more information on Watchdog Reset.

6.6 Trap Conflict Reset

If a lower-priority hard trap occurs while a higher-priority trap is being processed, a hard trap conflict Reset occurs. The hard traps include exceptions of priority level 13 through level 15, inclusive. The address error (level 13) and oscillator error (level 14) traps fall into this category.

The Trap Reset Flag bit (TRAPR) in the Reset Control register (RCON<15>) is set to indicate the Trap Conflict Reset. Refer to [Section 7.0 “Interrupt Controller”](#) for more information on trap conflict Resets.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

6.7 Configuration Mismatch Reset

To maintain the integrity of the peripheral pin select control registers, they are constantly monitored with shadow registers in hardware. If an unexpected change in any of the registers occur (such as cell disturbances caused by ESD or other external events), a configuration mismatch Reset occurs.

The Configuration Mismatch Flag bit (CM) in the Reset Control register (RCON<9>) is set to indicate the configuration mismatch Reset. Refer to [Section 10.0 “I/O Ports”](#) for more information on the configuration mismatch Reset.

Note: The configuration mismatch feature and associated reset flag is not available on all devices.

6.8 Illegal Condition Device Reset

An illegal condition device Reset occurs due to the following sources:

- Illegal Opcode Reset
- Uninitialized W Register Reset
- Security Reset

The Illegal Opcode or Uninitialized W Access Reset Flag bit (IOPUWR) in the Reset Control register (RCON<14>) is set to indicate the illegal condition device Reset.

6.8.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The illegal opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the illegal opcode Reset, use only the lower 16 bits of

each program memory section to store the data values. The upper 8 bits should be programmed with 3Fh, which is an illegal opcode value.

6.8.2 UNINITIALIZED W REGISTER RESET

Any attempts to use the uninitialized W register as an address pointer will Reset the device. The W register array (with the exception of W15) is cleared during all resets and is considered uninitialized until written to.

6.8.3 SECURITY RESET

If a Program Flow Change (PFC) or Vector Flow Change (VFC) targets a restricted location in a protected segment (Boot and Secure Segment), that operation will cause a security Reset.

The PFC occurs when the Program Counter is reloaded as a result of a Call, Jump, Computed Jump, Return, Return from Subroutine, or other form of branch instruction.

The VFC occurs when the Program Counter is reloaded with an Interrupt or Trap vector.

Refer to [Section 19.6 “Code Protection and CodeGuard™ Security”](#) for more information on Security Reset.

6.9 Using the RCON Status Bits

The user application can read the Reset Control register (RCON) after any device Reset to determine the cause of the reset.

Note: The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

[Table 6-3](#) provides a summary of the reset flag bit operation.

TABLE 6-3: RESET FLAG BIT OPERATION

| Flag Bit | Set by: | Cleared by: |
|------------------|---|--|
| TRAPR (RCON<15>) | Trap conflict event | POR,BOR |
| IOPWR (RCON<14>) | Illegal opcode or uninitialized W register access or Security Reset | POR,BOR |
| CM (RCON<9>) | Configuration Mismatch | POR,BOR |
| EXTR (RCON<7>) | MCLR Reset | POR |
| SWR (RCON<6>) | RESET instruction | POR,BOR |
| WDTO (RCON<4>) | WDT time-out | PWRSV instruction, CLRWDT instruction, POR,BOR |
| SLEEP (RCON<3>) | PWRSV #SLEEP instruction | POR,BOR |
| IDLE (RCON<2>) | PWRSV #IDLE instruction | POR,BOR |
| BOR (RCON<1>) | POR, BOR | — |
| POR (RCON<0>) | POR | — |

Note: All Reset flag bits can be set or cleared by user software.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

7.0 INTERRUPT CONTROLLER

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 6. “Interrupts”** (DS70184) of the “*dsPIC33F/PIC24H Family Reference Manual*”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 CPU. It has the following features:

- Up to eight processor exceptions and software traps
- Seven user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- Fixed interrupt entry and return latencies

7.1 Interrupt Vector Table

The Interrupt Vector Table is shown in [Figure 7-1](#). The IVT resides in program memory, starting at location 000004h. The IVT contains 126 vectors consisting of 8 nonmaskable trap vectors plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this priority is linked to their position in the vector table. Lower addresses generally have a higher natural priority. For example, the interrupt associated with vector 0 will take priority over interrupts at any other vector address.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices implement up to 21 unique interrupts and four nonmaskable traps. These are summarized in [Table 7-1](#) and [Table 7-2](#).

7.1.1 ALTERNATE INTERRUPT VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in [Figure 7-1](#). Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

7.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 device clears its registers in response to a Reset, which forces the PC to zero. The digital signal controller then begins program execution at location 0x000000. The user application can use a GOTO instruction at the Reset address which redirects program execution to the appropriate start-up routine.

Note: Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

7.3 Interrupt Control and Status Registers

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices implement a total of 17 registers for the interrupt controller:

- Interrupt Control Register 1 (INTCON1)
- Interrupt Control Register 2 (INTCON2)
- Interrupt Flag Status Registers (IFSx)
- Interrupt Enable Control Registers (IECx)
- Interrupt Priority Control Registers (IPCx)
- Interrupt Control and Status Register (INTTREG)

7.3.1 INTCON1 AND INTCON2

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

7.3.2 IFSx

The IFS registers maintain all of the interrupt request flags. Each source of interrupt has a status bit, which is set by the respective peripherals or external signal and is cleared via software.

7.3.3 IECx

The IEC registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals.

7.3.4 IPCx

The IPC registers are used to set the interrupt priority level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

7.3.5 INTTREG

The INTTREG register contains the associated interrupt vector number and the new CPU interrupt priority level, which are latched into the vector number (VECNUM<6:0>) and Interrupt level bits (ILR<3:0>) in the INTTREG register. The new interrupt priority level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence that they are listed in [Table 7-1](#). For example, the INTO (External Interrupt 0) is shown as having vector number 8 and a natural order priority of 0. Thus, the INTOIF bit is found in IFS0<0>, the INTOIE bit in IEC0<0>, and the INTOIP bits in the first position of IPC0 (IPC0<2:0>).

7.3.6 STATUS REGISTERS

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality:

- The CPU STATUS register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU interrupt priority level. The user can change the current CPU priority level by writing to the IPL bits.
- The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU priority level. IPL3 is a read-only bit, so that trap events cannot be masked by the user software.

All Interrupt bits and registers are described in [Register 7-1](#) through [Register 7-19](#).

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

REGISTER 7-1: SR: CPU STATUS REGISTER⁽¹⁾

| | | | | | | | |
|--------|-----|-------|-------|-----|-------|-----|-------|

- bit 3 **IPL3**: CPU Interrupt Priority Level Status bit⁽²⁾
- 1 = CPU interrupt priority level is greater than 7
 - 0 = CPU interrupt priority level is 7 or less

- Note 1:** For complete register details, see [Register 3-2](#).
- 2:** The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU Interrupt Priority Level.

7.4 Interrupt Setup Procedures

7.4.1 INITIALIZATION

To configure an interrupt source at initialization:

1. Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources can be programmed to the same non-zero value.

Note: At a device Reset, the IPCx registers are initialized such that all user interrupt sources are assigned to priority level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

7.4.2 INTERRUPT SERVICE ROUTINE

The method used to declare an Interrupt Service Routine (ISR) and initialize the IVT with the correct vector address depends on the programming language (C or Assembler) and the language development toolsuite used to develop the application.

In general, the user application must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, the program will re-enter the ISR immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a RETFIE instruction to unstack the saved PC value, SRL value and old CPU priority level.

7.4.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

7.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using this procedure:

1. Push the current SR value onto the software stack using the PUSH instruction.
2. Force the CPU to priority level 7 by inclusive ORing the value OEh with SRL.

To enable user interrupts, the POP instruction can be used to restore the previous SR value.

Note: Only user interrupts with a priority level of 7 or lower can be disabled. Trap sources (level 8-level 15) cannot be disabled.

The DISI instruction provides a convenient way to disable interrupts of priority levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the DISI instruction.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

8.0 OSCILLATOR CONFIGURATION

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Oscillator"** (DS70186) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).

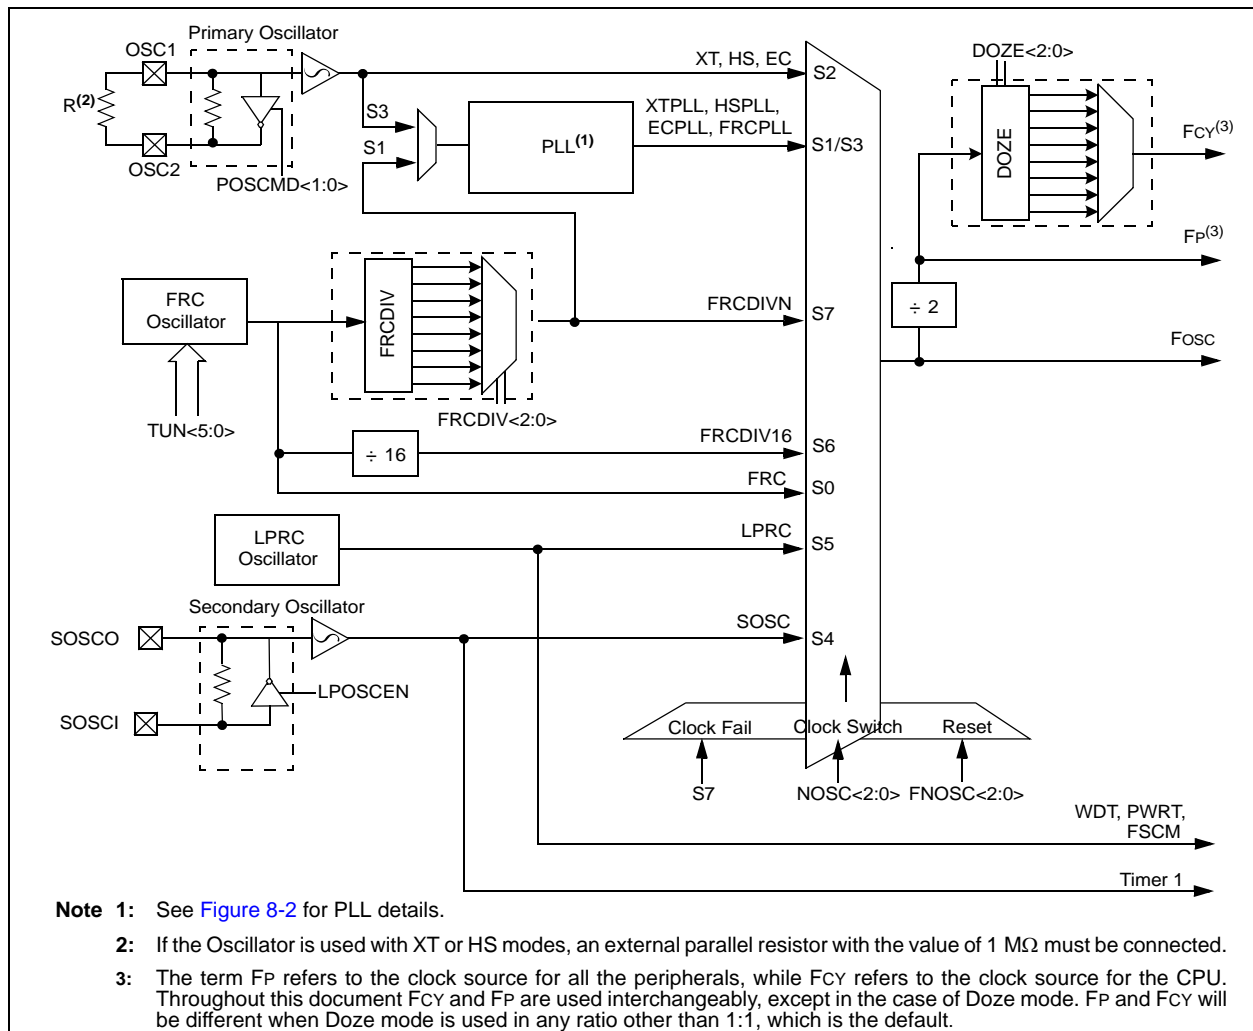

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 oscillator system provides:

- External and internal oscillator options as clock sources.
- An on-chip PLL to scale the internal operating frequency to the required system clock frequency.
- An internal FRC oscillator that can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware.
- Clock switching between various clock sources.
- Programmable clock postscaler for system power savings.
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures.
- An Oscillator Control register (OSCCON).
- Nonvolatile Configuration bits for main oscillator selection.

A simplified diagram of the oscillator system is shown in **Figure 8-1**.

FIGURE 8-1: dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 OSCILLATOR SYSTEM DIAGRAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

8.1 CPU Clocking System

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 device provides seven system clock options:

- Fast RC (FRC) Oscillator
- FRC Oscillator with PLL
- Primary (XT, HS or EC) Oscillator
- Primary Oscillator with PLL
- Secondary (LP) Oscillator
- Low-Power RC (LPRC) Oscillator
- FRC Oscillator with postscaler

8.1.1 SYSTEM CLOCK SOURCES

8.1.1.1 Fast RC

The Fast RC (FRC) internal oscillator runs at a nominal frequency of 7.37 MHz. User software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the `FRCDIV<2:0>` bits (`CLKDIV<10:8>`).

8.1.1.2 Primary

The primary oscillator can use one of the following as its clock source:

- XT (Crystal): Crystals and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- HS (High-Speed Crystal): Crystals in the range of 10 MHz to 40 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- EC (External Clock): The external clock signal is directly applied to the OSC1 pin.

8.1.1.3 Secondary

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSC1 and SOSC0 pins.

8.1.1.4 Low-Power RC

The Low-Power RC (LPRC) internal oscillator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

8.1.1.5 FRC

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip Phase Locked Loop (PLL) to provide a wide range of output frequencies for device operation. PLL configuration is described in [Section 8.1.3 “PLL Configuration”](#).

The FRC frequency depends on the FRC accuracy (see [Table 22-18](#)) and the value of the FRC Oscillator Tuning register (see [Register 8-4](#)).

8.1.2 SYSTEM CLOCK SELECTION

The oscillator source used at a device Power-on Reset event is selected using Configuration bit settings. The oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to [Section 19.1 “Configuration Bits”](#) for further details.) The Initial Oscillator Selection Configuration bits, `FNOSC<2:0>` (`FOSCSEL<2:0>`), and the Primary Oscillator Mode Select Configuration bits, `POSCMD<1:0>` (`FOSC<1:0>`), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose among 12 different clock modes, shown in [Table 8-1](#).

The output of the oscillator (or the output of the PLL if a PLL mode has been selected) `FOSC` is divided by 2 to generate the device instruction clock (`FCY`) and the peripheral clock time base (`FP`). `FCY` defines the operating speed of the device, and speeds up to 40 MHz are supported by the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 architecture.

Instruction execution speed or device operating frequency, `FCY`, is given by:

EQUATION 8-1: DEVICE OPERATING FREQUENCY

$$FCY = \frac{FOSC}{2}$$

8.1.3 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip PLL to obtain higher speeds of operation. The PLL provides significant flexibility in selecting the device operating speed. A block diagram of the PLL is shown in [Figure 8-2](#).

The output of the primary oscillator or FRC, denoted as ‘FIN’, is divided down by a prescale factor (`N1`) of 2, 3, ... or 33 before being provided to the PLL’s Voltage Controlled Oscillator (VCO). The input to the VCO must be selected in the range of 0.8 MHz to 8 MHz. The prescale factor ‘N1’ is selected using the `PLLPRE<4:0>` bits (`CLKDIV<4:0>`).

The PLL Feedback Divisor, selected using the `PLLDIV<8:0>` bits (`PLLFBD<8:0>`), provides a factor ‘M’, by which the input to the VCO is multiplied. This factor must be selected such that the resulting VCO output frequency is in the range of 100 MHz to 200 MHz.

The VCO output is further divided by a postscale factor ‘N2.’ This factor is selected using the `PLLPOST<1:0>` bits (`CLKDIV<7:6>`). ‘N2’ can be either 2, 4 or 8, and must be selected such that the PLL output frequency (`Fosc`) is in the range of 12.5 MHz to 80 MHz, which generates device operating speeds of 6.25-40 MIPS.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

For a primary oscillator or FRC oscillator, output 'Fin', The PLL output 'Fosc' is given by:

EQUATION 8-2: Fosc CALCULATION

$$F_{OSC} = F_{IN} \cdot \left(\frac{M}{N1 \cdot N2} \right)$$

For example, suppose a 10 MHz crystal is being used, with "XT with PLL" being the selected oscillator mode.

- If PLLPRE<4:0> = 0, then N1 = 2. This yields a VCO input of 10/2 = 5 MHz, which is within the acceptable range of 0.8-8 MHz.

- If PLLDIV<8:0> = 0x1E, then M = 32. This yields a VCO output of 5 x 32 = 160 MHz, which is within the 100-200 MHz range needed.
- If PLLPOST<1:0> = 0, then N2 = 2. This provides a Fosc of 160/2 = 80 MHz. The resultant device operating speed is 80/2 = 40 MIPS.

EQUATION 8-3: XT WITH PLL MODE EXAMPLE

$$F_{CY} = \frac{F_{OSC}}{2} = \frac{1}{2} \cdot \left(\frac{10000000 \cdot 32}{2 \cdot 2} \right) = 40 \text{ MIPS}$$

FIGURE 8-2: dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 PLL BLOCK DIAGRAM

TABLE 8-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

| Oscillator Mode | Oscillator Source | POSCMD<1:0> | FNOSC<2:0> | See Note |
|---|-------------------|-------------|------------|----------|
| Fast RC Oscillator with Divide-by-N (FRCDIVN) | Internal | xx | 111 | 1, 2 |
| Fast RC Oscillator with Divide-by-16 (FRCDIV16) | Internal | xx | 110 | 1 |
| Low-Power RC Oscillator (LPRC) | Internal | xx | 101 | 1 |
| Secondary (Timer1) Oscillator (SOSC) | Secondary | xx | 100 | 1 |
| Primary Oscillator (HS) with PLL (HSPLL) | Primary | 10 | 011 | — |
| Primary Oscillator (XT) with PLL (XTPLL) | Primary | 01 | 011 | — |
| Primary Oscillator (EC) with PLL (ECPLL) | Primary | 00 | 011 | 1 |
| Primary Oscillator (HS) | Primary | 10 | 010 | — |
| Primary Oscillator (XT) | Primary | 01 | 010 | — |
| Primary Oscillator (EC) | Primary | 00 | 010 | 1 |
| Fast RC Oscillator with PLL (FRCPLL) | Internal | xx | 001 | 1 |
| Fast RC Oscillator (FRC) | Internal | xx | 000 | 1 |

Note 1: OSC2 pin function is determined by the OSCIOFNC Configuration bit.

2: This is the default oscillator mode for an unprogrammed (erased) device.

bit 11 **Unimplemented:** Read as '0'

bit 10-8 **NOSC<2:0>:** New Oscillator Selection bits⁽²⁾

111 = Fast RC oscillator (FRC) with Divide-by-n
 110 = Fast RC oscillator (FRC) with Divide-by-16
 101 = Low-Power RC oscillator (LPRC)
 100 = Secondary oscillator (SOSC)
 011 = Primary oscillator (XT, HS, EC) with PLL
 010 = Primary oscillator (XT, HS, EC)
 001 = Fast RC oscillator (FRC) with PLL
 000 = Fast RC oscillator (FRC)

bit 7 **CLKLOCK:** Clock Lock Enable bit

If clock switching is enabled and FSCM is disabled (FOSC<FCKSM> = 0b01)

1 = Clock switching is disabled, system clock source is locked
 0 = Clock switching is enabled, system clock source can be modified by clock switching

bit 6 **IOLOCK:** Peripheral Pin Select Lock bit

1 = Peripheral Pin Select is locked, write to peripheral pin select register is not allowed
 0 = Peripheral Pin Select is unlocked, write to peripheral pin select register is allowed

bit 5 **LOCK:** PLL Lock Status bit (read-only)

1 = Indicates that PLL is in lock, or PLL start-up timer is satisfied
 0 = Indicates that PLL is out of lock, start-up timer is in progress or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

Note 1: Writes to this register require an unlock sequence. Refer to **Section 7. "Oscillator"** (DS70186) in the *"dsPIC33F/PIC24H Family Reference Manual"* for details.

2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

3: This register is reset only on a Power-on Reset (POR).

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

8.2 Clock Switching Operation

Applications are free to switch among any of the four clock sources (Primary, LP, FRC and LPRC) under software control at any time. To limit the possible side effects of this flexibility, dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices have a safeguard lock built into the switch process.

Note: Primary Oscillator mode has three different submodes (XT, HS and EC), which are determined by the POSCMD<1:0> Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch among the different primary submodes without reprogramming the device.

8.2.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the Configuration register must be programmed to '0'. (Refer to [Section 19.1 "Configuration Bits"](#) for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled. This is the default setting.

The NOSC control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSC bits (OSCCON<14:12>) reflect the clock source selected by the FNOSC Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled. It is held at '0' at all times.

8.2.2 OSCILLATOR SWITCHING SEQUENCE

Performing a clock switch requires this basic sequence:

1. If desired, read the COSC bits (OSCCON<14:12>) to determine the current oscillator source.
2. Perform the unlock sequence to allow a write to the OSCCON register high byte.
3. Write the appropriate value to the NOSC control bits (OSCCON<10:8>) for the new oscillator source.
4. Perform the unlock sequence to allow a write to the OSCCON register low byte.
5. Set the OSWEN bit to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

1. The clock switching hardware compares the COSC status bits with the new value of the NOSC control bits. If they are the same, the clock switch is a redundant operation. In this

case, the OSWEN bit is cleared automatically and the clock switch is aborted.

2. If a valid clock switch has been initiated, the status bits, LOCK (OSCCON<5>) and CF (OSCCON<3>) are cleared.
3. The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware waits until the Oscillator Start-up Timer (OST) expires. If the new source is using the PLL, the hardware waits until a PLL lock is detected (LOCK = 1).
4. The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
5. The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSC bit values are transferred to the COSC status bits.
6. The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM are enabled) or LP (if LPOSCEN remains set).

Note 1: The processor continues to execute code throughout the clock switching sequence. Timing-sensitive code should not be executed during this time.

- 2: Direct clock switches between any primary oscillator mode with PLL and FRC-PLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

- 3: Refer to [Section 7. "Oscillator"](#) (DS70186) in the *"dsPIC33F/PIC24H Family Reference Manual"* for details.

8.3 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate even in the event of an oscillator failure. The FSCM function is enabled by programming. If the FSCM function is enabled, the LPRC internal oscillator runs at all times (except during Sleep mode) and is not subject to control by the Watchdog Timer.

In the event of an oscillator failure, the FSCM generates a clock failure trap event and switches the system clock over to the FRC oscillator. Then the application program can either attempt to restart the oscillator or execute a controlled shutdown. The trap can be treated as a warm Reset by simply loading the Reset address into the oscillator fail trap vector.

If the PLL multiplier is used to scale the system clock, the internal FRC is also multiplied by the same factor on clock failure. Essentially, the device switches to FRC with PLL on a clock failure.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

9.0 POWER-SAVING FEATURES

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 9. “Watchdog Timer and Power Savings Modes”** (DS70196) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices can manage power consumption in four different ways:

- Clock frequency
- Instruction-based Sleep and Idle modes
- Software-controlled Doze mode
- Selective peripheral control in software

Combinations of these methods can be used to selectively tailor an application’s power consumption while still maintaining critical application features, such as timing-sensitive communications.

9.1 Clock Frequency and Clock Switching

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSC bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 8.0 “Oscillator Configuration”**.

EXAMPLE 9-1: PWRSAV INSTRUCTION SYNTAX

```
PWRSAV #SLEEP_MODE ; Put the device into SLEEP mode
PWRSAV #IDLE_MODE ; Put the device into IDLE mode
```

9.2 Instruction-Based Power-Saving Modes

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The Assembler syntax of the PWRSAV instruction is shown in [Example 9-1](#).

Note: SLEEP_MODE and IDLE_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to wake-up.

9.2.1 SLEEP MODE

The following occur in Sleep mode:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate, since the system clock source is disabled.
- The LPRC clock continues to run if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate. This includes items such as the input change notification on the I/O ports, or peripherals that use an external clock input.
- Any peripheral that requires the system clock source for its operation is disabled.

The device will wake-up from Sleep mode on any of the these events:

- Any interrupt source that is individually enabled
- Any form of device Reset
- A WDT time-out

On wake-up from Sleep mode, the processor restarts with the same clock source that was active when Sleep mode was entered.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

9.2.2 IDLE MODE

The following occur in Idle mode:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see [Section 9.4 “Peripheral Module Disable”](#)).
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device will wake from Idle mode on any of these events:

- Any interrupt that is individually enabled.
- Any form of device Reset
- A WDT time-out

On wake-up from Idle mode, the clock is reapplied to the CPU and instruction execution will begin (2-4 cycles later), starting with the instruction following the `PWRSVAV` instruction, or the first instruction in the ISR.

9.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a `PWRSVAV` instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

9.3 Doze Mode

The preferred strategies for reducing power consumption are changing clock speed and invoking one of the power-saving modes. In some circumstances, however, these are not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed can introduce communication errors, while using a power-saving mode can stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (`CLKDIV<11>`). The ratio between peripheral and core clock speed is determined by the `DOZE<2:0>` bits (`CLKDIV<14:12>`). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

Programs can use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. An automatic return to full-speed CPU operation on interrupts can be enabled by setting the ROI bit (`CLKDIV<15>`). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the CAN module has been configured for 500 kbps based on this device operating speed. If the device is placed in Doze mode with a clock frequency ratio of 1:4, the CAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

9.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled using the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers will have no effect and read values will be invalid.

A peripheral module is enabled only if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC[®] DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note: If a PMD bit is set, the corresponding module is disabled after a delay of one instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of one instruction cycle (assuming the module control registers are already configured to enable module operation).

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

10.0 I/O PORTS

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 10. “I/O Ports”** (DS70193) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

All of the device pins (except VDD, VSS, MCLR and OSC1/CLKI) are shared among the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

10.1 Parallel I/O (PIO) Ports

A parallel I/O port that shares a pin with a peripheral is generally subservient to the peripheral. The peripheral’s output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port

has ownership of the output data and control signals of the I/O pin. The logic also prevents “loop through”, in which a port’s digital output can drive the input of a peripheral that shares the same pin. **Figure 10-1** shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a ‘1’, then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx) read the latch. Writes to the latch, write the latch. Reads from the port (PORTx) read the port pins, while writes to the port pins write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LATx and TRISx registers and the port pin will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

FIGURE 10-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

10.2 Open-Drain Configuration

In addition to the PORT, LAT and TRIS registers for data control, some port pins can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired 5V tolerant pins by using external pull-up resistors. The maximum open-drain voltage allowed is the same as the maximum VIH specification.

See “[Pin Diagrams](#)” for the available pins and their functionality.

10.3 Configuring Analog Port Pins

The AD1PCFG and TRIS registers control the operation of the analog-to-digital (A/D) port pins. The port pins that are desired as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) will be converted.

The AD1PCFGL register has a default value of 0x0000; therefore, all pins that share ANx functions are analog (not digital) by default.

When the PORT register is read, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin that is defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

10.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically this instruction would be a NOP. Examples are shown in [Example 10-1](#) and [Example 10-2](#). This also applies to PORT bit operations, such as BSET PORTB, # RB0, which are single cycle read-modify-write. All PORT bit operations, such as MOV PORTB, W0 or BSET PORTB, # RBx, read the pin and *not* the latch.

10.5 Input Change Notification

The input change notification function of the I/O ports allows the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature can detect input change-of-states even in Sleep mode, when the clocks are disabled. Depending on the device pin count, up to 31 external signals (CNx pin) can be selected (enabled) for generating an interrupt request on a change-of-state.

Four control registers are associated with the CN module. The CNEN1 and CNEN2 registers contain the interrupt enable control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source connected to the pin, and eliminate the need for external resistors when push button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the control bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

Note: Pull-ups on change notification pins should always be disabled when the port pin is configured as a digital output.

EXAMPLE 10-1: PORT WRITE/READ

```
MOV    0xFF00, W0          ;Configure PORTB<15:8> as inputs
MOV    W0, TRISBB         ;and PORTB<7:0> as outputs
NOP                               ;Delay 1 cycle
BTSS   PORTB, #13         ;Next Instruction
```

EXAMPLE 10-2: PORT BIT OPERATIONS

```
Incorrect:
BSET   PORTB, #RB1        ;Set PORTB<RB1> high
BSET   PORTB, #RB6        ;Set PORTB<RB6> high

Correct:
BSET   PORTB, #RB1        ;Set PORTB<RB1> high
NOP
BSET   PORTB, #RB6        ;Set PORTB<RB6> high
NOP

Preferred:
BSET   LATB, LATB1        ;Set PORTB<RB1> high
BSET   LATB, LATB6        ;Set PORTB<RB6> high
```

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

10.6 Peripheral Pin Select

A major challenge in general-purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low-pin count devices. In an application where more than one peripheral must be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

Peripheral pin select configuration enables peripheral set selection and placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, programmers can better tailor the microcontroller to their entire application, rather than trimming the application to fit the device.

The peripheral pin select configuration feature operates over a fixed subset of digital I/O pins. Programmers can independently map the input and/or output of most digital peripherals to any one of these I/O pins. Peripheral pin select is performed in software, and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping, once it has been established.

10.6.1 AVAILABLE PINS

The peripheral pin select feature is used with a range of up to 26 pins. The number of available pins depends on the particular device and its pin count. Pins that support the peripheral pin select feature include the designation “RPn” in their full pin designation, where “RP” designates a remappable peripheral and “n” is the remappable pin number.

10.6.2 CONTROLLING PERIPHERAL PIN SELECT

Peripheral pin select features are controlled through two sets of special function registers: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

10.6.2.1 Input Mapping

The inputs of the peripheral pin select options are mapped on the basis of the peripheral. A control register associated with a peripheral dictates the pin it will be mapped to. The RPNR registers are used to configure peripheral input mapping (see [Register 10-1](#) through [Register 10-9](#)). Each register contains sets of 5-bit fields, with each set associated with one of the remappable peripherals. Programming a given peripheral's bit field with an appropriate 5-bit value maps the RPn pin with that value to that peripheral. For any given device, the valid range of values for any bit field corresponds to the maximum number of peripheral pin selections supported by the device.

[Figure 10-2](#) illustrates remappable pin selection for U1RX input.

Note: For input mapping only, the Peripheral Pin Select (PPS) functionality does not have priority over the TRISx settings. Therefore, when configuring the RPn pin for input, the corresponding bit in the TRISx register must also be configured for input (i.e., set to '1').

FIGURE 10-2: REMAPPABLE MUX INPUT FOR U1RX

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 10-1: REMAPPABLE PERIPHERAL INPUTS⁽¹⁾

| Input Name | Function Name | Register | Configuration Bits |
|-------------------------|--------------------|----------|--------------------|
| External Interrupt 1 | INT1 | RPINR0 | INT1R<4:0> |
| External Interrupt 2 | INT2 | RPINR1 | INT2R<4:0> |
| Timer2 External Clock | T2CK | RPINR3 | T2CKR<4:0> |
| Timer3 External Clock | T3CK | RPINR3 | T3CKR<4:0> |
| Input Capture 1 | IC1 | RPINR7 | IC1R<4:0> |
| Input Capture 2 | IC2 | RPINR7 | IC2R<4:0> |
| Input Capture 7 | IC7 | RPINR10 | IC7R<4:0> |
| Input Capture 8 | IC8 | RPINR10 | IC8R<4:0> |
| Output Compare Fault A | OCFA | RPINR11 | OCFAR<4:0> |
| UART1 Receive | U1RX | RPINR18 | U1RXR<4:0> |
| UART1 Clear To Send | $\overline{U1CTS}$ | RPINR18 | U1CTSR<4:0> |
| SPI1 Data Input | SDI1 | RPINR20 | SDI1R<4:0> |
| SPI1 Clock Input | SCK1IN | RPINR20 | SCK1R<4:0> |
| SPI1 Slave Select Input | SS1IN | RPINR21 | SS1R<4:0> |

Note 1: Unless otherwise noted, all inputs use the Schmitt input buffers.

10.6.2.2 Output Mapping

In contrast to inputs, the outputs of the peripheral pin select options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPORx registers are used to control output mapping. Like the RPINRx registers, each register contains sets of 5-bit fields, with each set associated with one RPn pin (see [Register 10-10](#) through [Register 10-22](#)). The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see [Table 10-2](#) and [Figure 10-3](#)).

The list of peripherals for output mapping also includes a null value of '00000' because of the mapping technique. This permits any given pin to remain unconnected from the output of any of the pin selectable peripherals.

FIGURE 10-3: MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPn

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 10-2: OUTPUT SELECTION FOR REMAPPABLE PIN (RPn)

| Function | RPnR<4:0> | Output Name |
|----------|-----------|--------------------------------------|
| NULL | 00000 | RPn tied to default port pin |
| U1TX | 00011 | RPn tied to UART1 Transmit |
| U1RTS | 00100 | RPn tied to UART1 Ready To Send |
| SDO1 | 00111 | RPn tied to SPI1 Data Output |
| SCK1OUT | 01000 | RPn tied to SPI1 Clock Output |
| SS1OUT | 01001 | RPn tied to SPI1 Slave Select Output |
| OC1 | 10010 | RPn tied to Output Compare 1 |
| OC2 | 10011 | RPn tied to Output Compare 2 |

10.6.3 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. dsPIC33F devices include three features to prevent alterations to the peripheral map:

- Control register lock sequence
- Continuous state monitoring
- Configuration bit pin select lock

10.6.3.1 Control Register Lock

Under normal operation, writes to the RPINRx and RPORx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK bit (OSCCON<6>). Setting IOLOCK prevents writes to the control registers; clearing IOLOCK allows writes.

To set or clear IOLOCK, a specific command sequence must be executed:

1. Write 0x46 to OSCCON<7:0>.
2. Write 0x57 to OSCCON<7:0>.
3. Clear (or set) IOLOCK as a single operation.

Note: MPLAB[®] C30 provides built-in C language functions for unlocking the OSCCON register:

```
__builtin_write_OSCCONL(value)  
__builtin_write_OSCCONH(value)
```

See MPLAB[®] IDE Help for more information.

Unlike the similar sequence with the oscillator's LOCK bit, IOLOCK remains in one state until changed. This allows all of the peripheral pin selects to be configured with a single unlock sequence followed by an update to all control registers, then locked with a second lock sequence.

10.6.3.2 Continuous State Monitoring

In addition to being protected from direct writes, the contents of the RPINRx and RPORx registers are constantly monitored in hardware by shadow registers. If an unexpected change in any of the registers occurs (such as cell disturbances caused by ESD or other external events), a configuration mismatch Reset will be triggered.

10.6.3.3 Configuration Bit Pin Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPINRx and RPORx registers. The IOL1WAY configuration bit (FOSC<5>) blocks the IOLOCK bit from being cleared after it has been set once.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session. Programming IOL1WAY allows user applications unlimited access (with the proper use of the unlock sequence) to the peripheral pin select registers.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

10.7 Peripheral Pin Select Registers

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices implement 17 registers for remappable peripheral configuration:

- Input Remappable Peripheral Registers (9)
- Output Remappable Peripheral Registers (8)

Note: Input and Output Register values can only be changed if OSCCON[IOLOCK] = 0. See [Section 10.6.3.1 “Control Register Lock”](#) for a specific command sequence.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

11.0 TIMER1

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70205) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Timer1 module is a 16-bit timer, which can serve as the time counter for the real-time clock, or operate as a free-running interval timer/counter. Timer1 can operate in three modes:

- 16-bit Timer
- 16-bit Synchronous Counter
- 16-bit Asynchronous Counter

Timer1 also supports these features:

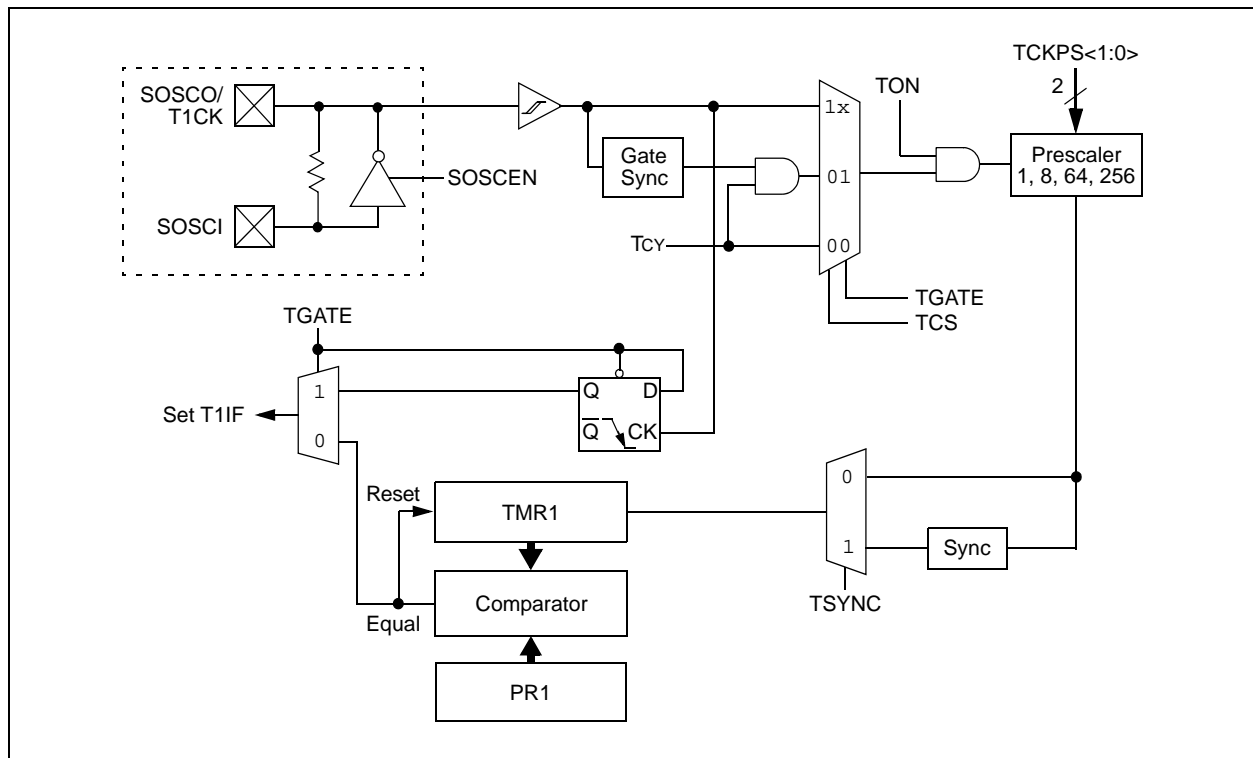

- Timer gate operation
- Selectable prescaler settings
- Timer operation during CPU Idle and Sleep modes
- Interrupt on 16-bit Period register match or falling edge of external gate signal

Figure 11-1 illustrates a block diagram of the 16-bit timer module.

To configure Timer1 for operation:

1. Set the TON bit (= 1) in the T1CON register.
2. Select the timer prescaler ratio using the TCKPS<1:0> bits in the T1CON register.
3. Set the Clock and Gating modes using the TCS and TGATE bits in the T1CON register.
4. Set or clear the TSYNC bit in the T1CON register to select synchronous or asynchronous operation.
5. Load the timer period value into the PR1 register.
6. If interrupts are required, set the interrupt enable bit, T1IE. Use the priority bits, T1IP<2:0>, to set the interrupt priority.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

12.0 TIMER2/3 FEATURE

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 11. “Timers”** (DS70205) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Timer2/3 feature has 32-bit timers that can also be configured as two independent 16-bit timers with selectable operating modes.

As a 32-bit timer, the Timer2/3 feature permits operation in three modes:

- Two Independent 16-bit timers (Timer2 and Timer3) with all 16-bit operating modes (except Asynchronous Counter mode)
- Single 32-bit timer (Timer2/3)
- Single 32-bit synchronous counter (Timer2/3)

The Timer2/3 feature also supports:

- Timer gate operation
- Selectable Prescaler Settings
- Timer operation during Idle and Sleep modes
- Interrupt on a 32-bit Period Register Match
- Time Base for Input Capture and Output Compare Modules (Timer2 and Timer3 only)
- ADC1 Event Trigger (Timer2/3 only)

Individually, all eight of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the event trigger. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON and T3CON registers. T2CON registers are shown in generic form in [Register 12-1](#). T3CON registers are shown in [Register 12-2](#).

For 32-bit timer/counter operation, Timer2 is the least significant word (lsw), and Timer3 is the most significant word (msw) of the 32-bit timers.

Note: For 32-bit operation, T3CON control bits are ignored. Only T2CON control bit is used for setup and control. Timer2 clock and gate inputs are used for the 32-bit timer modules, but an interrupt is generated with the Timer3 interrupt flags.

12.1 32-Bit Operation

To configure the Timer2/3 feature for 32-bit operation:

1. Set the corresponding T32 control bit.
2. Select the prescaler ratio for Timer2 using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
4. Load the timer period value. PR3 contains the most significant word of the value, while PR2 contains the least significant word.
5. If interrupts are required, set the interrupt enable bit, T3IE. Use the priority bits T3IP<2:0> to set the interrupt priority. While Timer2 controls the timer, the interrupt appears as a Timer3 interrupt.
6. Set the corresponding TON bit.

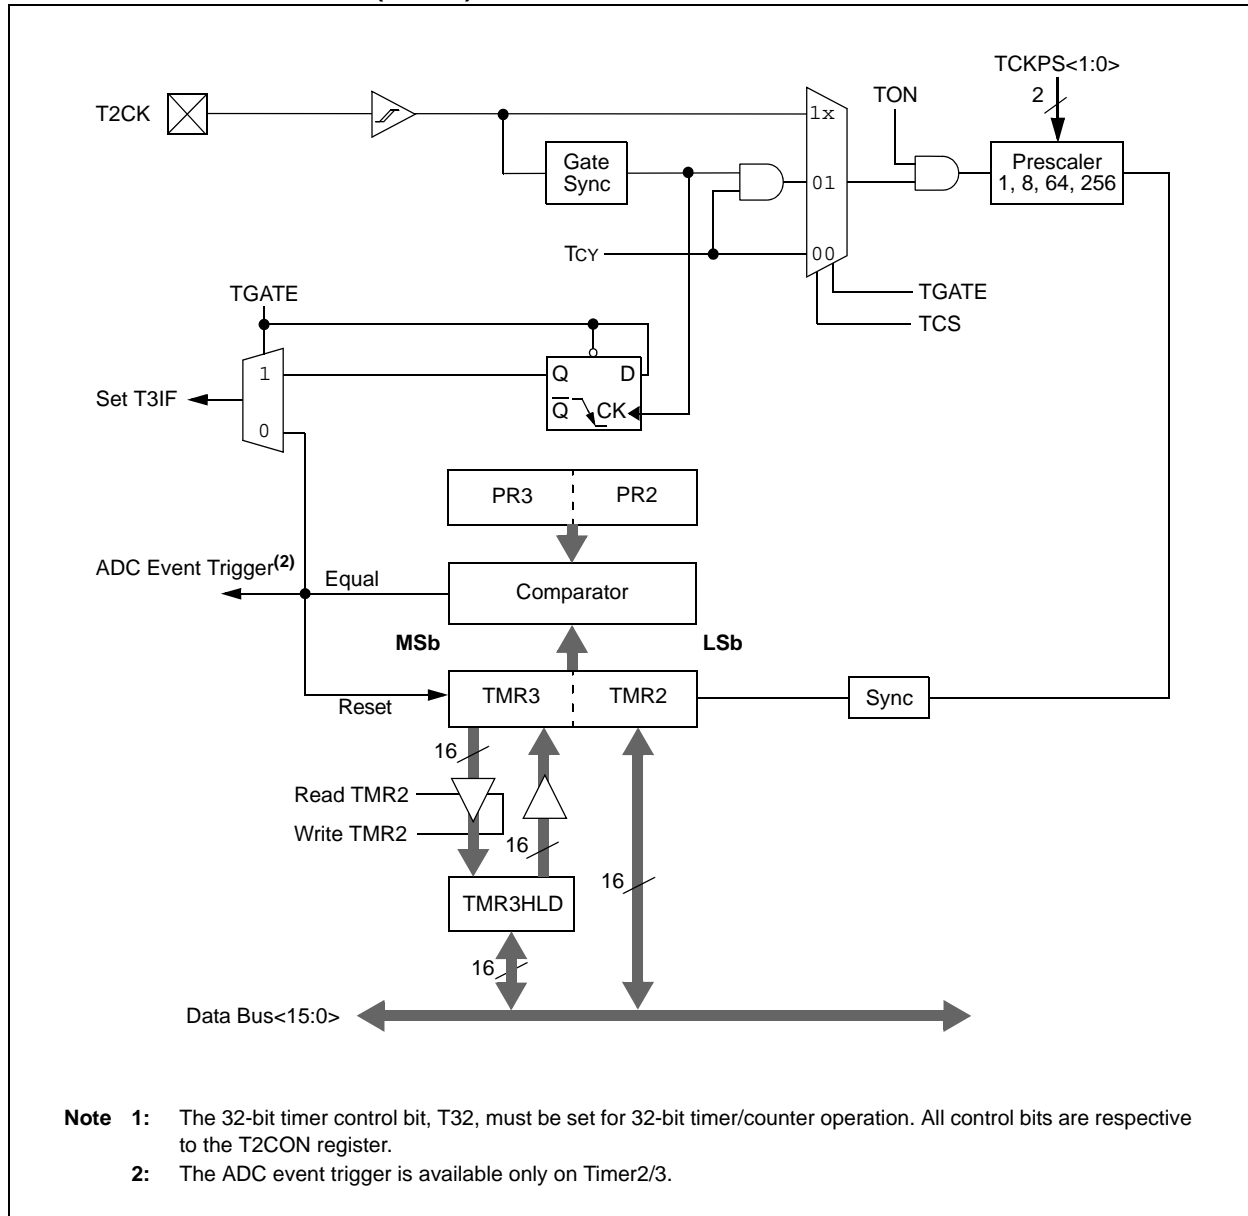

The timer value at any point is stored in the register pair TMR3:TMR2. TMR3 always contains the most significant word of the count, while TMR2 contains the least significant word.

To configure any of the timers for individual 16-bit operation:

1. Clear the T32 bit corresponding to that timer.
2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
3. Set the Clock and Gating modes using the TCS and TGATE bits.
4. Load the timer period value into the PRx register.
5. If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
6. Set the TON bit.

- 2:** When the 32-bit timer operation is enabled (T32 = 1) in the Timer Control register (T2CON<3>), these bits have no effect.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

13.0 INPUT CAPTURE

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "Input Capture"** (DS70198) of the "dsPIC33F/PIC24H Family Reference Manual", which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices support up to eight input capture channels.

The input capture module captures the 16-bit value of the selected Time Base register when an event occurs at the ICx pin. The events that cause a capture event are listed below in three categories:

- Simple Capture Event modes:
 - Capture timer value on every falling edge of input at ICx pin
 - Capture timer value on every rising edge of input at ICx pin
- Capture timer value on every edge (rising and falling).
- Prescaler Capture Event modes:
 - Capture timer value on every 4th rising edge of input at ICx pin
 - Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select one of two 16-bit timers (Timer2 or Timer3) for the time base. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during CPU Sleep and Idle modes
- Interrupt on input capture event
- 4-word FIFO buffer for capture values
 - Interrupt optionally generated after 1, 2, 3 or 4 buffer locations are filled
- Use of input capture to provide additional sources of external interrupts

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

14.0 OUTPUT COMPARE

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 13. “Output Compare”** (DS70209) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Output Compare module can select either Timer2 or Timer3 for its time base. The module compares the value of the timer with the value of one or two compare registers depending on the operating mode selected. The state of the output pin changes when the timer value matches the compare register value. The Output Compare module generates either a single output pulse or a sequence of output pulses, by changing the state of the output pin on the compare match events. The Output Compare module can also generate interrupts on compare match events.

The Output Compare module has multiple operating modes:

- Active-Low One-Shot mode
- Active-High One-Shot mode
- Toggle mode
- Delayed One-Shot mode
- Continuous Pulse mode
- PWM mode without fault protection
- PWM mode with fault protection

FIGURE 14-1: OUTPUT COMPARE MODULE BLOCK DIAGRAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

14.1 Output Compare Modes

Configure the Output Compare modes by setting the appropriate Output Compare Mode bits (OCM<2:0>) in the Output Compare Control register (OCxCON<2:0>). Table 14-1 lists the different bit settings for the Output Compare modes. Figure 14-2 illustrates the output compare operation for various modes. The user

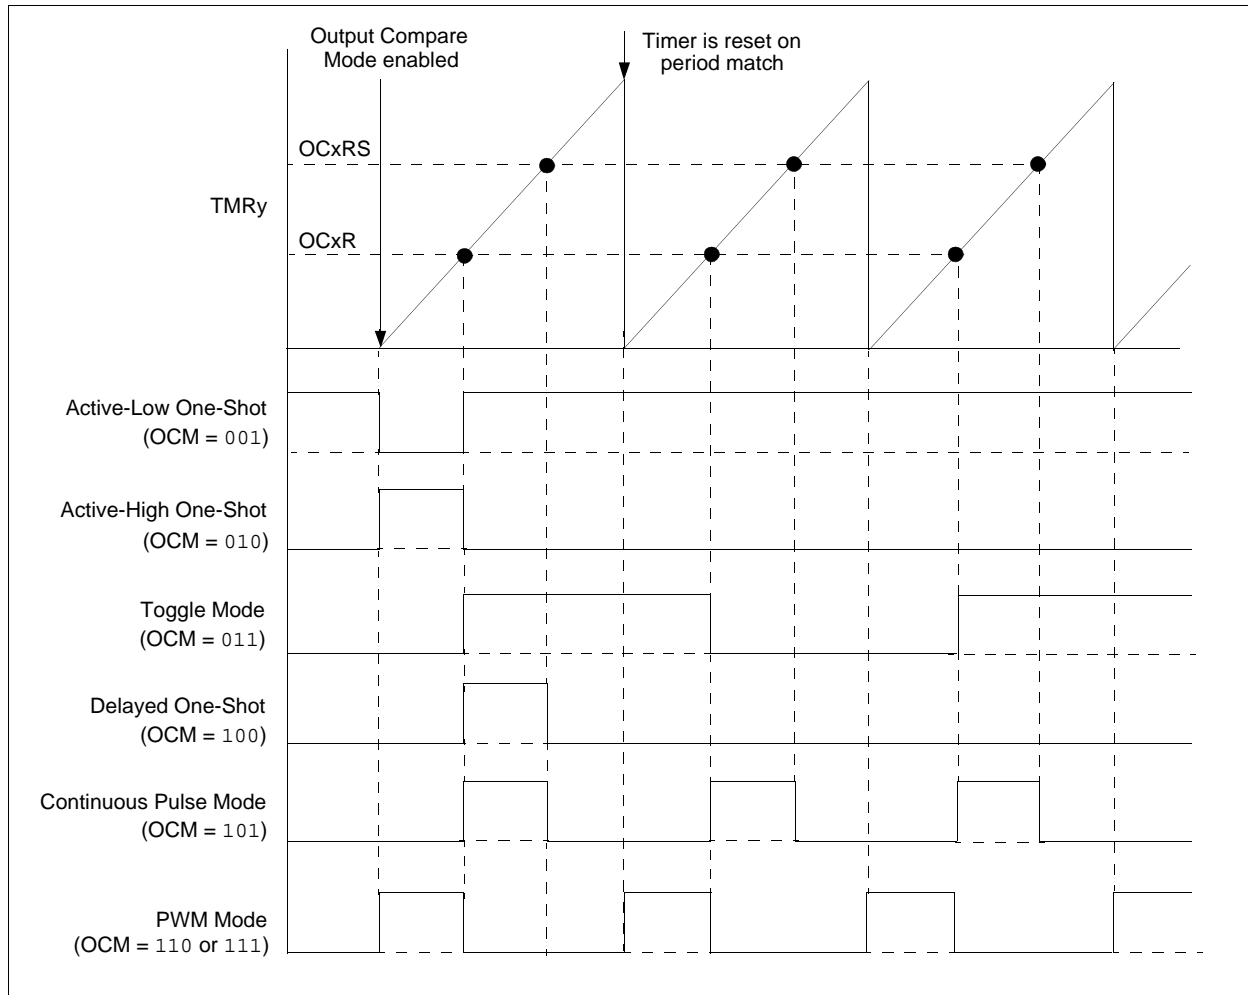

application must disable the associated timer when writing to the output compare control registers to avoid malfunctions.

Note: See Section 13. “Output Compare” (DS70209) in the “dsPIC33F/PIC24H Family Reference Manual” for OCxR and OCxRS register restrictions.

TABLE 14-1: OUTPUT COMPARE MODES

| OCM<2:0> | Mode | OCx Pin Initial State | OCx Interrupt Generation |
|----------|-----------------------------------|--|----------------------------------|
| 000 | Module Disabled | Controlled by GPIO register | — |
| 001 | Active-Low One-Shot | 0 | OCx Rising edge |
| 010 | Active-High One-Shot | 1 | OCx Falling edge |

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

15.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 18. “Serial Peripheral Interface (SPI)”** (DS70206) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available from the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, Analog-to-Digital Converters (ADC), etc. The SPI module is compatible with Motorola® SPI and SIOP.

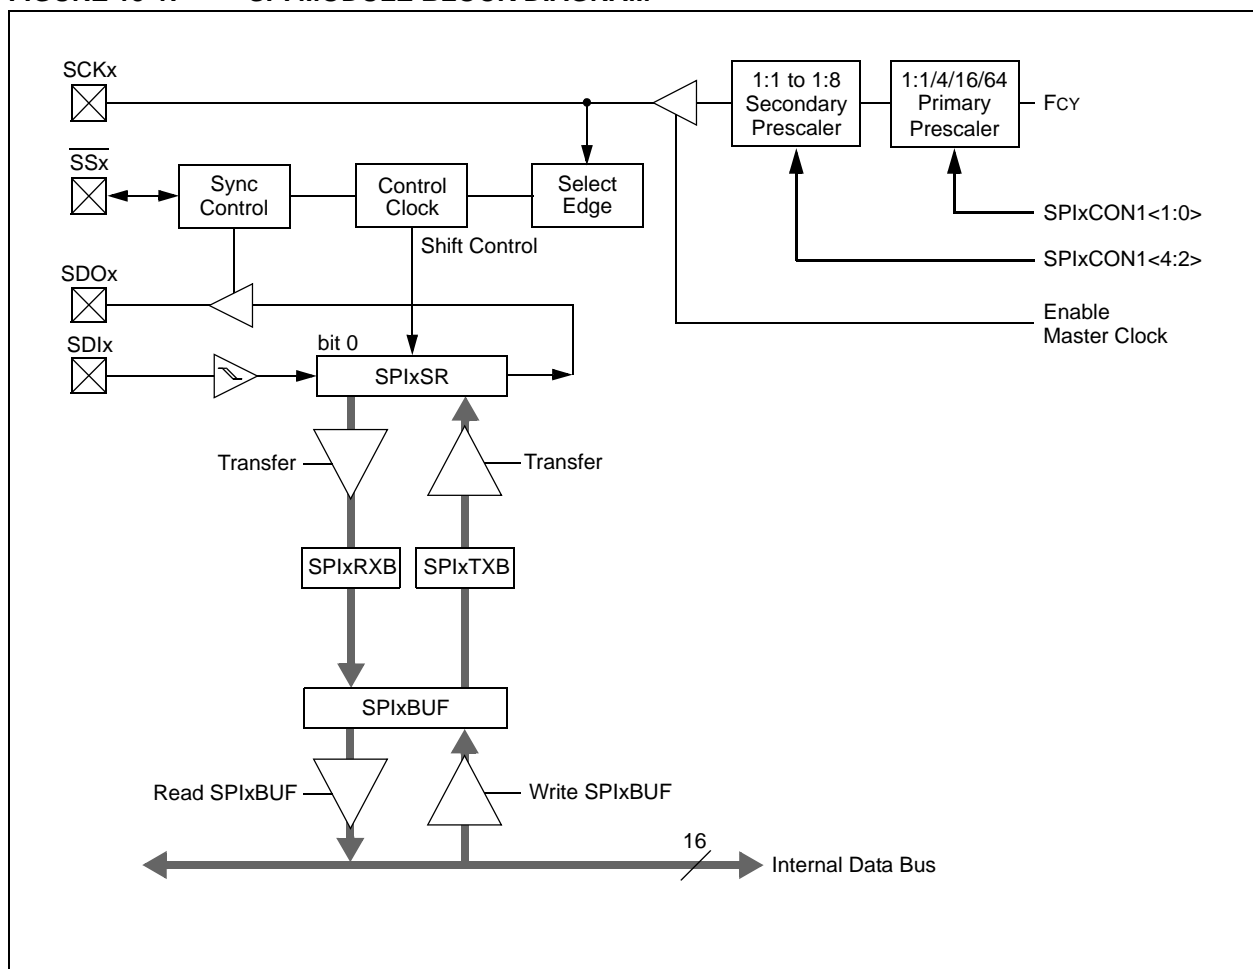

Each SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates status conditions.

The serial interface consists of 4 pins:

- SDIx (serial data input)
- SDOx (serial data output)
- SCKx (shift clock input or output)
- SSx (active-low slave select)

In Master mode operation, SCK is a clock output. In Slave mode, it is a clock input.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

16.0 INTER-INTEGRATED CIRCUIT™ (I²C™)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 19. “Inter-Integrated Circuit™ (I²C™)”** (DS70195) of the “*dsPIC33F/PIC24H Family Reference Manual*”, which is available on the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit (I²C) module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard, with a 16-bit interface.

The I²C module has a 2-pin interface:

- The SCLx pin is clock
- The SDAx pin is data

The I²C module offers the following key features:

- I²C interface supporting both Master and Slave modes of operation
- I²C Slave mode supports 7-bit and 10-bit addressing
- I²C Master mode supports 7-bit and 10-bit addressing
- I²C port allows bidirectional transfers between master and slaves
- Serial clock synchronization for I²C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control)
- I²C supports multi-master operation, detects bus collision and arbitrates accordingly

16.1 Operating Modes

The hardware fully implements all the master and slave functions of the I²C Standard and Fast mode specifications, as well as 7-bit and 10-bit addressing.

The I²C module can operate either as a slave or a master on an I²C bus.

The following types of I²C operation are supported:

- I²C slave operation with 7-bit addressing
- I²C slave operation with 10-bit addressing
- I²C master operation with 7-bit or 10-bit addressing

For details about the communication sequence in each of these modes, refer to the “*dsPIC33F/PIC24H Family Reference Manual*”.

16.2 I²C Registers

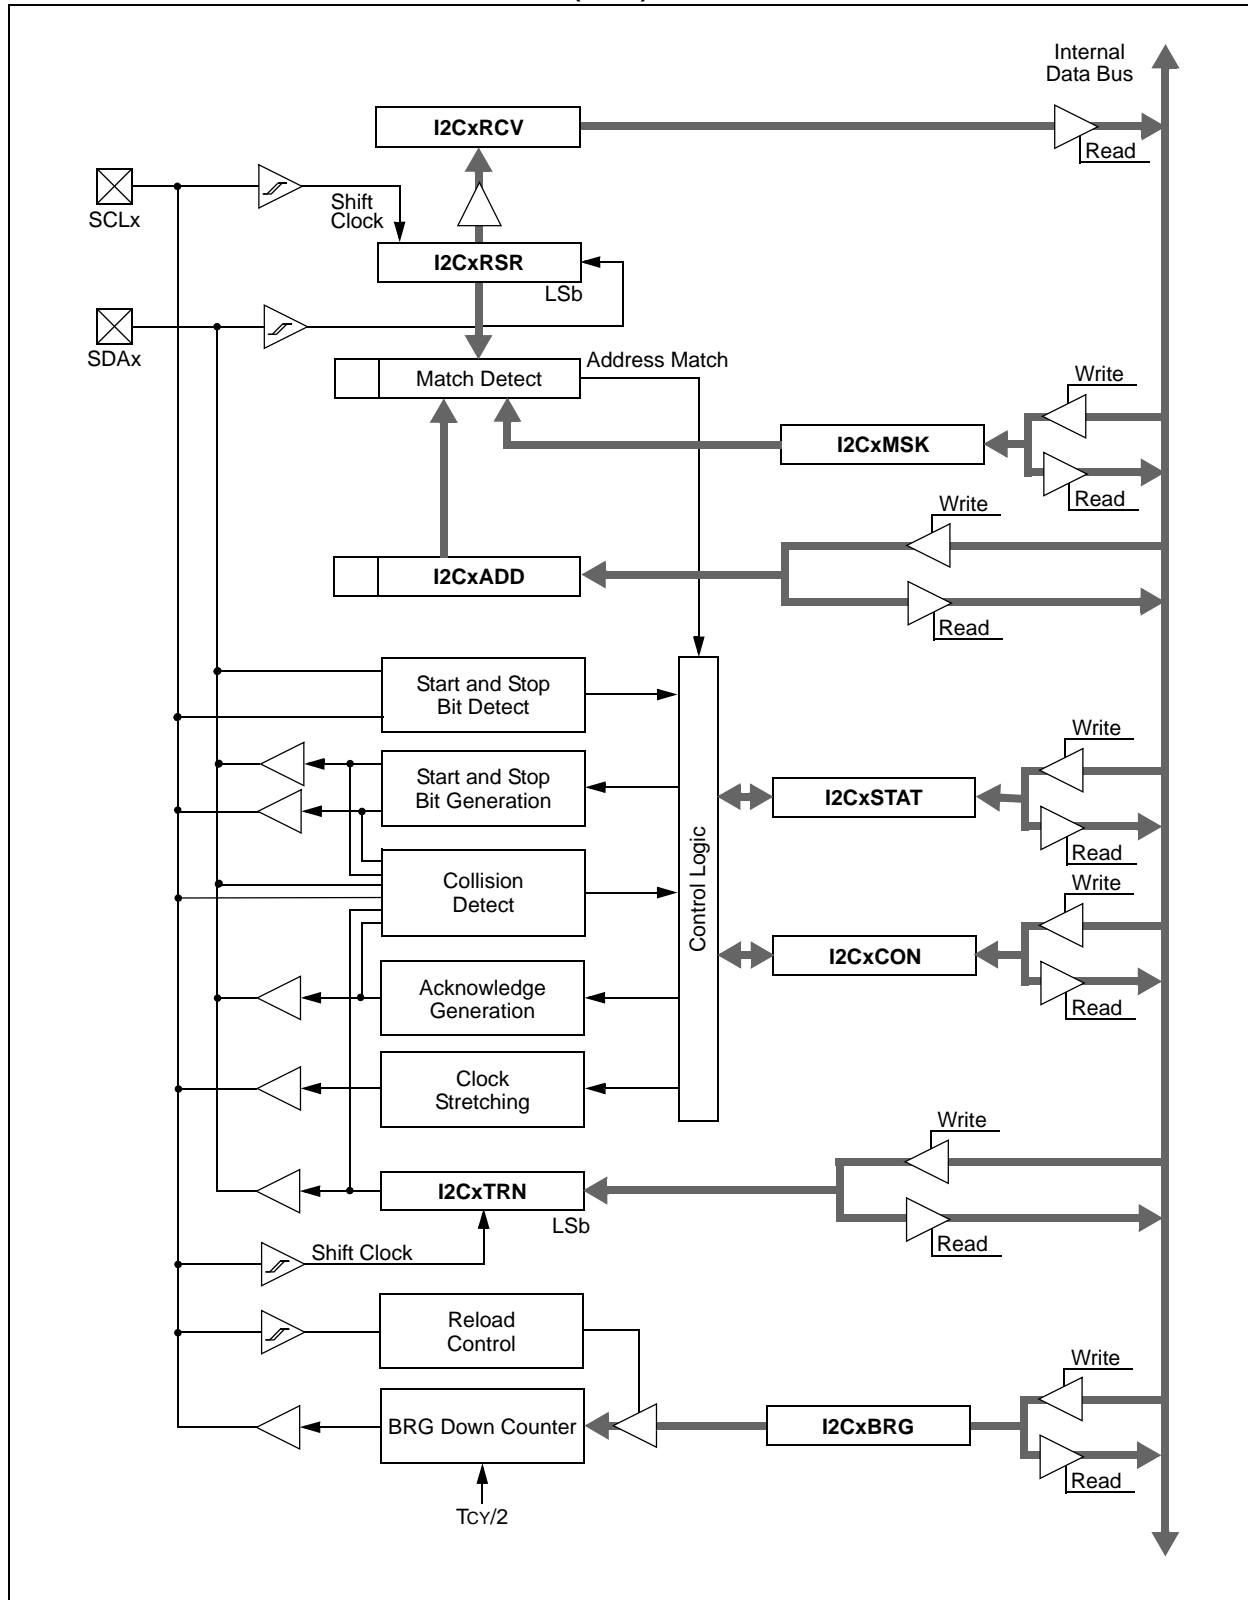

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CxSTAT are read/write.

- I2CxRSR is the shift register used for shifting data.
- I2CxRCV is the receive buffer and the register to which data bytes are written, or from which data bytes are read.
- I2CxTRN is the transmit register to which bytes are written during a transmit operation.
- The I2CxADD register holds the slave address.
- A status bit, ADD10, indicates 10-bit Address mode.
- I2CxBRG acts as the Baud Rate Generator (BRG) reload value.

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV, and an interrupt pulse is generated.

 0 = Hold SCLx clock low (clock stretch)
If STREN = 1:
 Bit is R/W (i.e., software can write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.
If STREN = 0:
 Bit is R/S (i.e., software can only write '1' to release clock). Hardware clear at beginning of slave transmission.
- bit 11 **IPMIEN:** Intelligent Peripheral Management Interface (IPMI) Enable bit
 1 = IPMI mode is enabled; all addresses Acknowledged
 0 = IPMI mode disabled
- bit 10 **A10M:** 10-bit Slave Address bit
 1 = I2CxADD is a 10-bit slave address
 0 = I2CxADD is a 7-bit slave address
- bit 9 **DISSLW:** Disable Slew Rate Control bit
 1 = Slew rate control disabled
 0 = Slew rate control enabled
- bit 8 **SMEN:** SMBus Input Levels bit
 1 = Enable I/O pin thresholds compliant with SMBus specification
 0 = Disable SMBus input thresholds
- bit 7 **GCEN:** General Call Enable bit (when operating as I²C slave)
 1 = Enable interrupt when a general call address is received in the I2CxRSR (module is enabled for reception)
 0 = General call address disabled
- bit 6 **STREN:** SCLx Clock Stretch Enable bit (when operating as I²C slave)
 Used in conjunction with SCLREL bit.
 1 = Enable software or receive clock stretching
 0 = Disable software or receive clock stretching

REGISTER 16-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

- bit 5 **ACKDT:** Acknowledge Data bit (when operating as I²C master, applicable during master receive)
Value that will be transmitted when the software initiates an Acknowledge sequence.
1 = Send NACK during Acknowledge
0 = Send ACK during Acknowledge
- bit 4 **ACKEN:** Acknowledge Sequence Enable bit
(when operating as I²C master, applicable during master receive)
1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit.
Hardware clear at end of master Acknowledge sequence
0 = Acknowledge sequence not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I²C master)
1 = Enables Receive mode for I²C. Hardware clear at end of eighth bit of master receive data byte
0 = Receive sequence not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I²C master)
1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence
0 = Stop condition not in progress
- bit 1 **RSEN:** Repeated Start Condition Enable bit (when operating as I²C master)
1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of
master Repeated Start sequence
0 = Repeated Start condition not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I²C master)
1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence
0 = Start condition not in progress

- bit 10 **BCL:** Master Bus Collision Detect bit
1 = A bus collision has been detected during a master operation
0 = No collision
Hardware set at detection of bus collision.
- bit 9 **GCSTAT:** General Call Status bit
1 = General call address was received
0 = General call address was not received
Hardware set when address matches general call address. Hardware clear at Stop detection.
- bit 8 **ADD10:** 10-bit Address Status bit
1 = 10-bit address was matched
0 = 10-bit address was not matched
Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.
- bit 7 **IWCOL:** Write Collision Detect bit
1 = An attempt to write the I2CxTRN register failed because the I²C module is busy
0 = No collision
Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).
- bit 6 **I2COV:** Receive Overflow Flag bit
1 = A byte was received while the I2CxRCV register is still holding the previous byte
0 = No overflow
Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).
- bit 5 **D_A:** Data/Address bit (when operating as I²C slave)
1 = Indicates that the last byte received was data
0 = Indicates that the last byte received was device address
Hardware clear at device address match. Hardware set by reception of slave byte.
- bit 4 **P:** Stop bit
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last
Hardware set or clear when Start, Repeated Start or Stop detected.

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

17.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 17. “UART”** (DS70188) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available on the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 device family. The UART is a full-duplex asynchronous system that can communicate with peripheral devices, such as personal computers, LIN, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the UxCTS and UxRTS pins and also includes an IrDA® encoder and decoder.

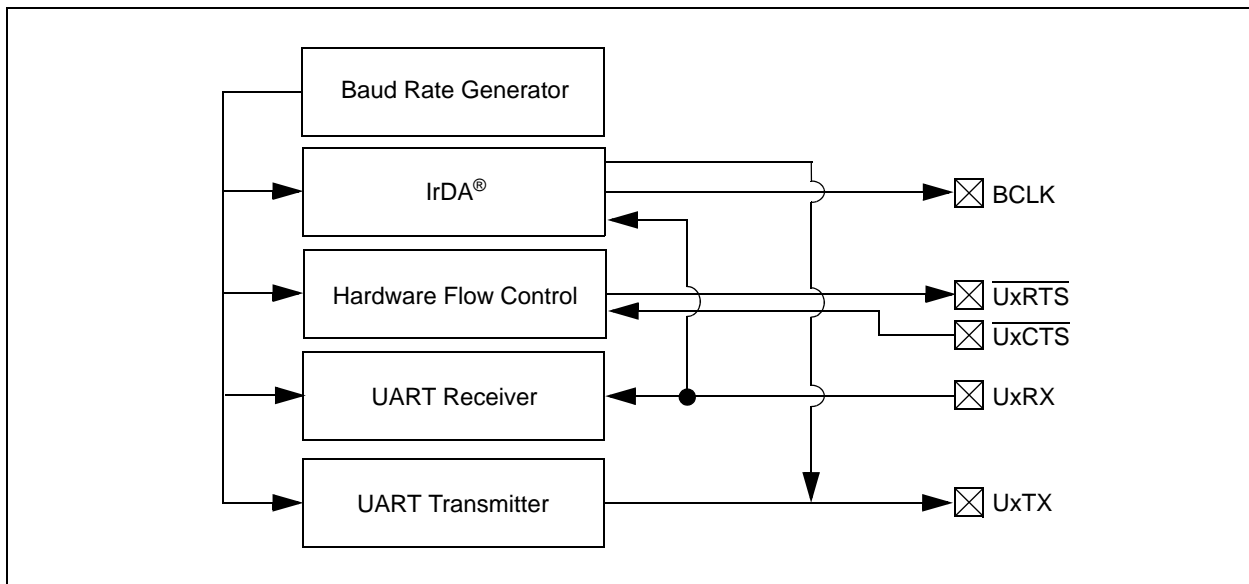

The primary features of the UART module are:

- Full-Duplex, 8-bit or 9-bit Data Transmission through the UxTX and UxRX pins
- Even, odd or no parity options (for 8-bit data)
- One or two stop bits
- Hardware Flow Control Option with $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins
- Fully Integrated Baud Rate Generator with 16-bit prescaler
- Baud rates ranging from 10 Mbps to 38 bps at 40 MIPS
- 4-deep first-in-first-out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, framing and buffer overrun error detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive interrupts
- A separate interrupt for all UART error conditions
- Loopback mode for diagnostic support
- Support for Sync and Break characters
- Support for automatic baud rate detection
- IrDA® encoder and decoder logic
- 16x baud clock output for IrDA® support

A simplified block diagram of the UART module is shown in **Figure 17-1**. The UART module consists of these key hardware elements:

- Baud Rate Generator
- Asynchronous Transmitter
- Asynchronous Receiver

REGISTER 17-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 5 **ADDEN:** Address Character Detect bit (bit 8 of received data = 1)
1 = Address Detect mode enabled. If 9-bit mode is not selected, this does not take effect
0 = Address Detect mode disabled
- bit 4 **RIDLE:** Receiver Idle bit (read-only)
1 = Receiver is Idle
0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
0 = Parity error has not been detected
- bit 2 **FERR:** Framing Error Status bit (read-only)
1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
0 = Framing error has not been detected
- bit 1 **OERR:** Receive Buffer Overrun Error Status bit (read/clear only)
1 = Receive buffer has overflowed
0 = Receive buffer has not overflowed. Clearing a previously set OERR bit (1 → 0 transition) will reset the receiver buffer and the UxRSR to the empty state
- bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
1 = Receive buffer has data, at least one more character can be read
0 = Receive buffer is empty

Note 1: Refer to **Section 17. “UART”** (DS70188) in the “*dsPIC33F/PIC24H Family Reference Manual*” for information on enabling the UART module for transmit operation.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

18.0 10-BIT/12-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 16. “Analog-to-Digital Converter (ADC)”** (DS70183) of the “dsPIC33F/PIC24H Family Reference Manual”, which is available on the Microchip website (www.microchip.com).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 “Memory Organization”** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices have up to 13 Analog-to-Digital Conversion (ADC) module input channels.

The AD12B bit (AD1CON1<10>) allows each of the ADC modules to be configured as either a 10-bit, 4-sample-and-hold ADC (default configuration) or a 12-bit, 1-sample-and-hold ADC.

Note: The ADC module must be disabled before the AD12B bit can be modified.

18.1 Key Features

The 10-bit ADC configuration has the following key features:

- Successive Approximation (SAR) conversion
- Conversion speeds of up to 1.1 Msps
- Up to 13 analog input pins
- External voltage reference input pins
- Simultaneous sampling of up to four analog input pins
- Automatic Channel Scan mode
- Selectable conversion trigger source
- Selectable Buffer Fill modes
- Four result alignment options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle modes
- 16-word conversion result buffer

The 12-bit ADC configuration supports all the above features, except:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported.
- There is only one sample and hold (S&H) amplifier in the 12-bit configuration, so simultaneous sampling of multiple channels is not supported.

Depending on the particular device pinout, the ADC can have up to 13 analog input pins, designated AN0 through AN12. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs can be shared with other analog input pins.

The actual number of analog input pins and external voltage reference input configuration will depend on the specific device. Refer to the specific device data sheet for further details.

A block diagram of the ADC for the dsPIC33FJ16GP304 and dsPIC33FJ32GP204 devices is shown in [Figure 18-1](#). A block diagram of the ADC for the dsPIC33FJ32GP202 device is shown in [Figure 18-2](#).

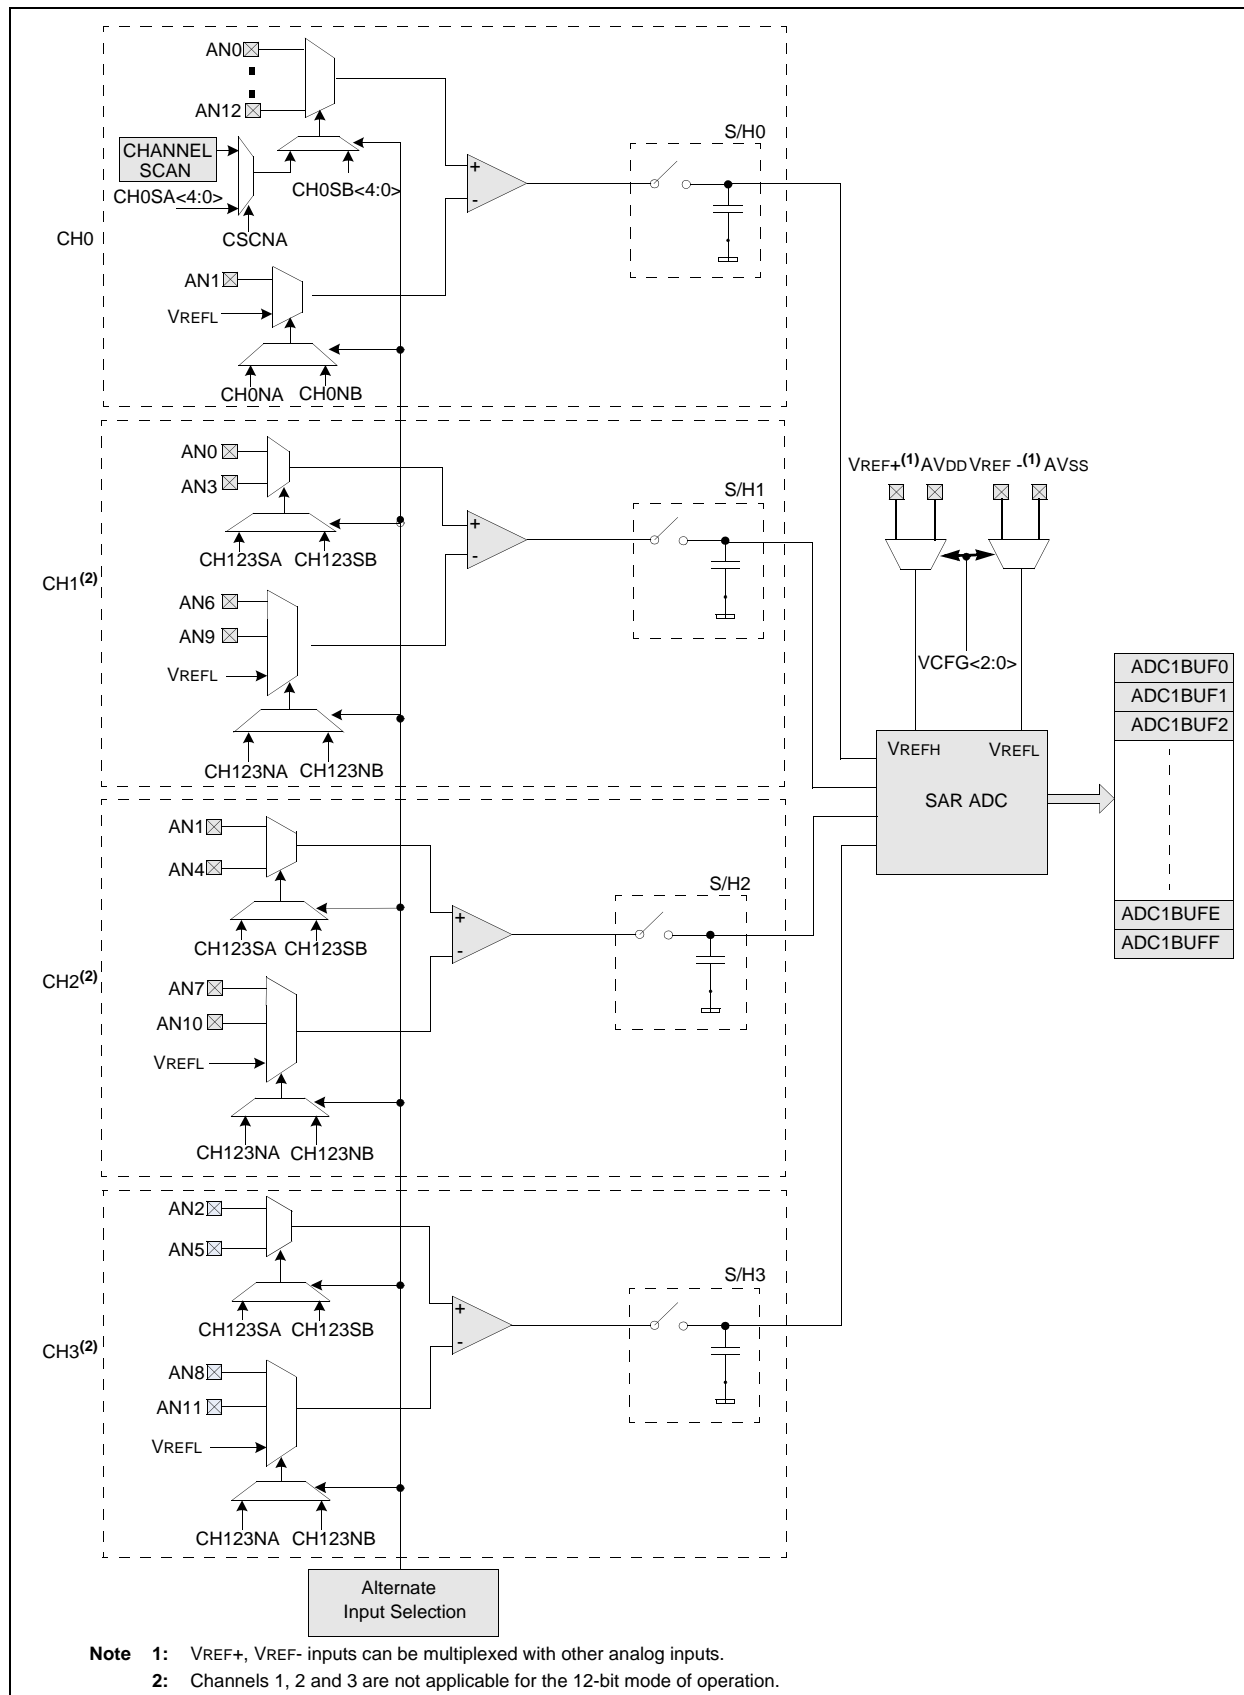

18.2 ADC Initialization

To configure the ADC module:

1. Select port pins as analog inputs (AD1PCFGH<15:0> or AD1PCFGL<15:0>).
2. Select voltage reference source to match expected range on analog inputs (AD1CON2<15:13>).
3. Select the analog conversion clock to match desired data rate with processor clock (AD1CON3<7:0>).
4. Determine how many sample-and-hold channels will be used (AD1CON2<9:8> and AD1PCFGH<15:0> or AD1PCFGL<15:0>).
5. Select the appropriate sample/conversion sequence (AD1CON1<7:5> and AD1CON3<12:8>).
6. Select the way conversion results are presented in the buffer (AD1CON1<9:8>).
 - a) Turn on the ADC module (AD1CON1<15>).
7. Configure ADC interrupt (if required):
 - a) Clear the AD1IF bit.
 - b) Select ADC interrupt priority.

 110 = Reserved
 101 = Motor Control PWM2 interval ends sampling and starts conversion
 100 = Reserved
 011 = Motor Control PWM1 interval ends sampling and starts conversion
 010 = GP timer 3 compare ends sampling and starts conversion
 001 = Active transition on INT0 pin ends sampling and starts conversion
 000 = Clearing sample bit ends sampling and starts conversion
- bit 4 **Unimplemented:** Read as '0'
- bit 3 **SIMSAM:** Simultaneous Sample Select bit (applicable only when CHPS<1:0> = 01 or 1x)
When AD12B = 1, SIMSAM is: U-0, Unimplemented, Read as '0'
 1 = Samples CH0, CH1, CH2, CH3 simultaneously (when CHPS<1:0> = 1x); or
 Samples CH0 and CH1 simultaneously (when CHPS<1:0> = 01)
 0 = Samples multiple channels individually in sequence

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

REGISTER 18-1: AD1CON1: ADC1 CONTROL REGISTER 1 (CONTINUED)

- bit 2 **ASAM:** ADC Sample Auto-Start bit
1 = Sampling begins immediately after last conversion. SAMP bit is auto-set
0 = Sampling begins when SAMP bit is set
- bit 1 **SAMP:** ADC Sample Enable bit
1 = ADC sample-and-hold amplifiers are sampling
0 = ADC sample-and-hold amplifiers are holding
If ASAM = 0, software can write '1' to begin sampling. Automatically set by hardware if ASAM = 1.
If SSRC = 000, software can write '0' to end sampling and start conversion. If SSRC ≠ 000,
automatically cleared by hardware to end sampling and start conversion.
- bit 0 **DONE:** ADC Conversion Status bit
1 = ADC conversion cycle is completed
0 = ADC conversion not started or in progress
Automatically set by hardware when ADC conversion is complete. Software can write '0' to clear
DONE status (software not allowed to write '1'). Clearing this bit will NOT affect any operation in
progress. Automatically cleared by hardware at start of a new conversion.

2: PCFGx = ANx, where x = 0 through 12.
3: The PCFGx bits have no effect if the ADC module is disabled by setting ADxMD bit in the PMDx Register. In this case, all port pins multiplexed with ANx will be in Digital mode.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

19.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- JTAG Boundary Scan Interface
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

19.1 Configuration Bits

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices provide nonvolatile memory implementation for device configuration bits. Refer to **Section 25. “Device Configuration”** (DS70194) of the “dsPIC33F/PIC24H Family Reference Manual”, for more information on this implementation.

The Configuration bits can be programmed (read as ‘0’), or left unprogrammed (read as ‘1’), to select various device configurations. These bits are mapped starting at program memory location 0xF80000.

The Device Configuration register map is shown in [Table 19-1](#).

The individual Configuration bit descriptions for the Configuration registers are shown in [Table 19-2](#).

Note that address 0xF80000 is beyond the user program memory space. It belongs to the configuration memory space (0x800000-0xFFFFF), which can only be accessed using table reads and table writes.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

19.2 On-Chip Voltage Regulator

All of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices power their core digital logic at a nominal 2.5V. This can create a conflict for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR (less than 5 ohms) capacitor (such as tantalum or ceramic) must be connected to the VCAP pin (Figure 19-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in Table 22-13 located in Section 22.1 “DC Characteristics”.

Note: It is important for the low-ESR capacitor to be placed as close as possible to the VCAP pin.

On a POR, it takes approximately 20 μ s for the on-chip voltage regulator to generate an output voltage. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down.

FIGURE 19-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR⁽¹⁾

19.3 BOR: Brown-Out Reset

The Brown-out Reset (BOR) module is based on an internal voltage reference circuit that monitors the regulated voltage VCAP. The main purpose of the BOR module is to generate a device Reset when a brown-out condition occurs. Brown-out conditions are generally caused by glitches on the AC mains (for example, missing portions of the AC cycle waveform due to bad power transmission lines, or voltage sags due to excessive current draw when a large inductive load is turned on).

A BOR generates a Reset pulse, which resets the device. The BOR selects the clock source, based on the device Configuration bit values (FNOSC<2:0> and POSCMD<1:0>).

If an oscillator mode is selected, the BOR activates the Oscillator Start-up Timer (OST). The system clock is held until OST expires. If the PLL is used, the clock is held until the LOCK bit (OSCCON<5>) is '1'.

Concurrently, the PWRT time-out (TPWRT) will be applied before the internal Reset is released. If TPWRT = 0 and a crystal oscillator is being used, a nominal delay of TFSCM = 100 is applied. The total delay in this case is TFSCM.

The BOR Status bit (RCON<1>) is set to indicate that a BOR has occurred. The BOR circuit continues to operate while in Sleep or Idle modes and resets the device should VDD fall below the BOR threshold voltage.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

19.4 Watchdog Timer (WDT)

For dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

19.4.1 PRESCALER/POSTSCALER

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler that can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a nominal WDT time-out period (T_{WDT}) of 1 ms in 5-bit mode, or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>), which allow the selection of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSC bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- By a CLRWDT instruction during normal execution

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

19.4.2 SLEEP AND IDLE MODES

If the WDT is enabled, it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake the device and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bits (RCON<3:2>) will need to be cleared in software after the device wakes up.

19.4.3 ENABLING WDT

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user application to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

Note: If the WINDIS bit (FWDT<6>) is cleared, the CLRWDT instruction should be executed by the application software only during the last 1/4 of the WDT period. This CLRWDT window can be determined by using a timer. If a CLRWDT instruction is executed before this window, a WDT Reset occurs.

FIGURE 19-2: WDT BLOCK DIAGRAM

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

19.5 JTAG Interface

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices implement a JTAG interface, which supports boundary scan device testing, as well as in-circuit programming. Detailed information on this interface will be provided in future revisions of the document.

19.6 Code Protection and CodeGuard™ Security

The dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 product families offer the intermediate implementation of CodeGuard™ Security. CodeGuard Security enables multiple parties to securely share resources (memory, interrupts and

peripherals) on a single chip. This feature helps protect individual Intellectual Property in collaborative system designs.

When coupled with software encryption libraries, CodeGuard™ Security can be used to securely update Flash even when multiple IPs reside on the single chip.

The code protection features are controlled by the Configuration registers: FBS and FGS. The Secure segment and RAM is not implemented.

Note: Refer to **Section 23. “CodeGuard™ Security”** (DS70199) in the “dsPIC33F/PIC24H Family Reference Manual” for further information on usage, configuration and operation of CodeGuard Security.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

19.7 In-Circuit Serial Programming

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family digital signal controllers can be serially programmed while in the end application circuit. This is done with two lines for clock and data and three other lines for power, ground and the programming sequence. Serial programming allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. Serial programming also allows the most recent firmware or a custom firmware to be programmed. Refer to the “*dsPIC33F/PIC24H Flash Programming Specification*” (DS70152) document for details about In-Circuit Serial Programming (ICSP).

Any of the three pairs of programming clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

19.8 In-Circuit Debugger

When MPLAB® ICD 2 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx (Emulation/Debug Clock) and PGEDx (Emulation/Debug Data) pin functions.

Any of the three pairs of debugging clock/data pins can be used:

- PGEC1 and PGED1
- PGEC2 and PGED2
- PGEC3 and PGED3

To use the in-circuit debugger function of the device, the design must implement ICSP connections to MCLR, VDD, VSS, and the PGECx/PGEDx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

20.0 INSTRUCTION SET SUMMARY

Note: This data sheet summarizes the features of the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the “dsPIC33F/PIC24H Family Reference Manual”. Please see the Microchip web site (www.microchip.com) for the latest dsPIC33F/PIC24H Family Reference Manual sections.

The dsPIC33F instruction set is identical to that of the dsPIC30F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 20-1 shows the general symbols used in describing the instructions.

The dsPIC33F instruction set summary in Table 20-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register ‘Wb’ without any address modifier
- The second source operand, which is typically a register ‘Ws’ with or without an address modifier
- The destination of the result, which is typically a register ‘Wd’ with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value ‘f’
- The destination, which could be either the file register ‘f’ or the W0 register, which is denoted as ‘WREG’

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of ‘Ws’ or ‘f’)
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register ‘Wb’)

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by ‘k’)
- The W register or file register where the literal value is to be loaded (specified by ‘Wb’ or ‘f’)

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register ‘Wb’ without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register ‘Wd’ with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register ‘Wn’ or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the table read and table write instructions

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Most instructions are a single word. Certain double-word instructions are designed to provide all of the required information in these 48 bits. In the second word, the 8 MSBs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP. The double-word instructions execute in two instruction cycles.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the program counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO,

all table reads and writes and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles.

Note: For more details on the instruction set, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

TABLE 20-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

| Field | Description |
|-----------------|---|
| #text | Means literal defined by "text" |
| (text) | Means "content of text" |
| [text] | Means "the location addressed by text" |
| { } | Optional field or operation |
| <n:m> | Register bit field |
| .b | Byte mode selection |
| .d | Double-Word mode selection |
| .S | Shadow register select |
| .w | Word mode selection (default) |
| Acc | One of two accumulators {A, B} |
| AWB | Accumulator write back destination address register $\in \{W13, [W13]+ = 2\}$ |
| bit4 | 4-bit bit selection field (used in word addressed instructions) $\in \{0...15\}$ |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero |
| Expr | Absolute address, label or expression (resolved by the linker) |
| f | File register address $\in \{0x0000...0x1FFF\}$ |
| lit1 | 1-bit unsigned literal $\in \{0,1\}$ |
| lit4 | 4-bit unsigned literal $\in \{0...15\}$ |
| lit5 | 5-bit unsigned literal $\in \{0...31\}$ |
| lit8 | 8-bit unsigned literal $\in \{0...255\}$ |
| lit10 | 10-bit unsigned literal $\in \{0...255\}$ for Byte mode, $\{0:1023\}$ for Word mode |
| lit14 | 14-bit unsigned literal $\in \{0...16384\}$ |
| lit16 | 16-bit unsigned literal $\in \{0...65535\}$ |
| lit23 | 23-bit unsigned literal $\in \{0...8388608\}$; LSb must be '0' |
| None | Field does not require an entry, may be blank |
| OA, OB, SA, SB | DSP Status bits: AccA Overflow, AccB Overflow, AccA Saturate, AccB Saturate |
| PC | Program Counter |
| Slit10 | 10-bit signed literal $\in \{-512...511\}$ |
| Slit16 | 16-bit signed literal $\in \{-32768...32767\}$ |
| Slit6 | 6-bit signed literal $\in \{-16...16\}$ |
| Wb | Base W register $\in \{W0..W15\}$ |
| Wd | Destination W register $\in \{Wd, [Wd], [Wd++] , [Wd--], [++Wd], [--Wd] \}$ |
| Wdo | Destination W register $\in \{Wnd, [Wnd], [Wnd++] , [Wnd--], [++Wnd], [--Wnd], [Wnd+Wb] \}$ |
| Wm,Wn | Dividend, Divisor working register pair (direct addressing) |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 20-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

| Field | Description |
|-------|---|
| Wm*Wm | Multiplicand and Multiplier working register pair for Square instructions $\in \{W4 * W4, W5 * W5, W6 * W6, W7 * W7\}$ |
| Wm*Wn | Multiplicand and Multiplier working register pair for DSP instructions $\in \{W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7\}$ |
| Wn | One of 16 working registers $\in \{W0..W15\}$ |
| Wnd | One of 16 destination working registers $\in \{W0..W15\}$ |
| Wns | One of 16 source working registers $\in \{W0..W15\}$ |
| WREG | W0 (working register used in file register instructions) |
| Ws | Source W register $\in \{Ws, [Ws], [Ws++] , [Ws--], [++Ws], [--Ws] \}$ |
| Wso | Source W register $\in \{Wns, [Wns], [Wns++] , [Wns--], [++Wns], [--Wns], [Wns+Wb] \}$ |
| Wx | X data space prefetch address register for DSP instructions $\in \{[W8]+ = 6, [W8]+ = 4, [W8]+ = 2, [W8], [W8]- = 6, [W8]- = 4, [W8]- = 2, [W9]+ = 6, [W9]+ = 4, [W9]+ = 2, [W9], [W9]- = 6, [W9]- = 4, [W9]- = 2, [W9 + W12], \text{none}\}$ |
| Wxd | X data space prefetch destination register for DSP instructions $\in \{W4..W7\}$ |
| Wy | Y data space prefetch address register for DSP instructions $\in \{[W10]+ = 6, [W10]+ = 4, [W10]+ = 2, [W10], [W10]- = 6, [W10]- = 4, [W10]- = 2, [W11]+ = 6, [W11]+ = 4, [W11]+ = 2, [W11], [W11]- = 6, [W11]- = 4, [W11]- = 2, [W11 + W12], \text{none}\}$ |
| Wyd | Y data space prefetch destination register for DSP instructions $\in \{W4..W7\}$ |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

21.0 DEVELOPMENT SUPPORT

The PIC® microcontrollers and dsPIC® digital signal controllers are supported with a full range of software and hardware development tools:

- Integrated Development Environment
 - MPLAB® IDE Software
- Compilers/Assemblers/Linkers
 - MPLAB C Compiler for Various Device Families
 - HI-TECH C for Various Device Families
 - MPASM™ Assembler
 - MPLINK™ Object Linker/
MPLIB™ Object Librarian
 - MPLAB Assembler/Linker/Librarian for Various Device Families
- Simulators
 - MPLAB SIM Software Simulator
- Emulators
 - MPLAB REAL ICE™ In-Circuit Emulator
- In-Circuit Debuggers
 - MPLAB ICD 3
 - PICKit™ 3 Debug Express
- Device Programmers
 - PICKit™ 2 Programmer
 - MPLAB PM3 Device Programmer
- Low-Cost Demonstration/Development Boards, Evaluation Kits, and Starter Kits

21.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16/32-bit microcontroller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- A single graphical interface to all debugging tools
 - Simulator
 - Programmer (sold separately)
 - In-Circuit Emulator (sold separately)
 - In-Circuit Debugger (sold separately)
- A full-featured editor with color-coded context
- A multiple project manager
- Customizable data windows with direct edit of contents
- High-level source code debugging
- Mouse over variable inspection
- Drag and drop variables from source to watch windows
- Extensive on-line help
- Integration of select third party tools, such as IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either C or assembly)
- One-touch compile or assemble, and download to emulator and simulator tools (automatically updates all project information)
- Debug using:
 - Source files (C or assembly)
 - Mixed C and assembly
 - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

21.2 MPLAB C Compilers for Various Device Families

The MPLAB C Compiler code development systems are complete ANSI C compilers for Microchip's PIC18, PIC24 and PIC32 families of microcontrollers and the dsPIC30 and dsPIC33 families of digital signal controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

21.3 HI-TECH C for Various Device Families

The HI-TECH C Compiler code development systems are complete ANSI C compilers for Microchip's PIC family of microcontrollers and the dsPIC family of digital signal controllers. These compilers provide powerful integration capabilities, omniscient code generation and ease of use.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

The compilers include a macro assembler, linker, pre-processor, and one-step driver, and can run on multiple platforms.

21.4 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

21.5 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

21.6 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC devices. MPLAB C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command line interface
- Rich directive set
- Flexible macro language
- MPLAB IDE compatibility

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

21.7 MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC® DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

21.8 MPLAB REAL ICE In-Circuit Emulator System

MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs PIC® Flash MCUs and dsPIC® Flash DSCs with the easy-to-use, powerful graphical user interface of the MPLAB Integrated Development Environment (IDE), included with each kit.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB IDE. In upcoming releases of MPLAB IDE, new devices will be supported, and new features will be added. MPLAB REAL ICE offers significant advantages over competitive emulators including low-cost, full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, a ruggedized probe interface and long (up to three meters) interconnection cables.

21.9 MPLAB ICD 3 In-Circuit Debugger System

MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost effective high-speed hardware debugger/programmer for Microchip Flash Digital Signal Controller (DSC) and microcontroller (MCU) devices. It debugs and programs PIC® Flash microcontrollers and dsPIC® DSCs with the powerful, yet easy-to-use graphical user interface of MPLAB Integrated Development Environment (IDE).

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

21.10 PICKit 3 In-Circuit Debugger/ Programmer and PICKit 3 Debug Express

The MPLAB PICKit 3 allows debugging and programming of PIC® and dsPIC® Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB Integrated Development Environment (IDE). The MPLAB PICKit 3 is connected to the design engineer's PC using a full speed USB interface and can be connected to the target via an Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the reset line to implement in-circuit debugging and In-Circuit Serial Programming™.

The PICKit 3 Debug Express include the PICKit 3, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

21.11 PICkit 2 Development Programmer/Debugger and PICkit 2 Debug Express

The PICkit™ 2 Development Programmer/Debugger is a low-cost development tool with an easy to use interface for programming and debugging Microchip's Flash families of microcontrollers. The full featured Windows® programming interface supports baseline (PIC10F, PIC12F5xx, PIC16F5xx), midrange (PIC12F6xx, PIC16F), PIC18F, PIC24, dsPIC30, dsPIC33, and PIC32 families of 8-bit, 16-bit, and 32-bit microcontrollers, and many Microchip Serial EEPROM products. With Microchip's powerful MPLAB Integrated Development Environment (IDE) the PICkit™ 2 enables in-circuit debugging on most PIC® microcontrollers. In-Circuit Debugging runs, halts and single steps the program while the PIC microcontroller is embedded in the application. When halted at a breakpoint, the file registers can be examined and modified.

The PICkit 2 Debug Express include the PICkit 2, demo board and microcontroller, hookup cables and CDROM with user's guide, lessons, tutorial, compiler and MPLAB IDE software.

21.12 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an MMC card for file storage and data applications.

21.13 Demonstration/Development Boards, Evaluation Kits, and Starter Kits

A wide variety of demonstration, development and evaluation boards for various PIC MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM™ and dsPICDEM™ demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, KEELOQ® security ICs, CAN, IrDA®, PowerSmart battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Also available are starter kits that contain everything needed to experience the specified device. This usually includes a single application and debug capability, all on one board.

Check the Microchip web page (www.microchip.com) for the complete list of demonstration, development and evaluation kits.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

22.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 family are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|---|-----------------------|
| Ambient temperature under bias | -40°C to +125°C |
| Storage temperature | -65°C to +160°C |
| Voltage on VDD with respect to VSS | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant with respect to VSS ⁽⁴⁾ | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V ⁽⁴⁾ | -0.3V to +5.6V |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V ⁽⁴⁾ | -0.3V to 3.6V |
| Voltage on VCAP with respect to VSS | 2.25V to 2.75V |
| Maximum current out of VSS pin | 300 mA |
| Maximum current into VDD pin ⁽²⁾ | 250 mA |
| Maximum output current sunk by any I/O pin ⁽³⁾ | 4 mA |
| Maximum output current sourced by any I/O pin ⁽³⁾ | 4 mA |
| Maximum current sunk by all ports | 200 mA |
| Maximum current sourced by all ports ⁽²⁾ | 200 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see [Table 22-2](#)).

3: Exceptions are CLKOUT, which is able to sink/source 25 mA, and the VREF+, VREF-, SCLx, SDAX, PGECx and PGEDx pins, which are able to sink/source 12 mA.

4: Refer to the “[Pin Diagrams](#)” section for 5V tolerant pins.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

22.1 DC Characteristics

TABLE 22-1: OPERATING MIPS VS. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temp Range (in °C) | Max MIPS |
|----------------|-------------------------|-----------------------|--|
| | | | dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 |
| | 3.0-3.6V | -40°C to +85°C | 40 |
| | 3.0-3.6V | -40°C to +125°C | 40 |

TABLE 22-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|--|--------|---------------------------|-----|------|------|
| Industrial Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +125 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +85 | °C |
| Extended Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +155 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +125 | °C |
| Power Dissipation: Internal chip power dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \Sigma I_{OH})$ I/O Pin Power Dissipation: $I/O = \Sigma (\{V_{DD} - V_{OH}\} \times I_{OH}) + \Sigma (V_{OL} \times I_{OL})$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 22-3: THERMAL PACKAGING CHARACTERISTICS

| Characteristic | Symbol | Typ | Max | Unit | Notes |
|--|---------------|-----|-----|------|-------|
| Package Thermal Resistance, 44-pin QFN | θ_{JA} | 32 | — | °C/W | 1 |
| Package Thermal Resistance, 44-pin TFQP | θ_{JA} | 45 | — | °C/W | 1 |
| Package Thermal Resistance, 28-pin SPDIP | θ_{JA} | 45 | — | °C/W | 1 |
| Package Thermal Resistance, 28-pin SOIC | θ_{JA} | 50 | — | °C/W | 1 |
| Package Thermal Resistance, 28-pin SSOP | θ_{JA} | 71 | — | °C/W | 1 |
| Package Thermal Resistance, 28-pin QFN-S | θ_{JA} | 35 | — | °C/W | 1 |

Note 1: Junction to ambient thermal resistance, Theta-JA (θ_{JA}) numbers are achieved by package simulations.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-4: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------------|-----------------------|---|---|--------------------|------|-------|---|
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| Operating Voltage | | | | | | | |
| DC10 | Supply Voltage | | | | | | |
| | VDD | — | 3.0 | — | 3.6 | V | Industrial and Extended |
| DC12 | VDR | RAM Data Retention Voltage⁽²⁾ | 1.8 | — | — | V | — |
| DC16 | VPOR | VDD Start Voltage to ensure internal Power-on Reset signal | — | — | VSS | V | — |
| DC17 | SVDD | VDD Rise Rate to ensure internal Power-on Reset signal | 0.03 | — | — | V/ms | 0-3.0V in 0.1s |
| DC18 | VCORE | VDD Core⁽³⁾ Internal regulator voltage | 2.25 | — | 2.75 | V | Voltage is dependent on load, temperature and VDD |

- Note 1:** Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.
Note 2: This is the limit to which VDD can be lowered without losing RAM data.
Note 3: These parameters are characterized, but are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-5: DC CHARACTERISTICS: OPERATING CURRENT (IDD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | |
|--|------------------------|-----|---|------------|------|------------------------|
| Parameter No. | Typical ⁽¹⁾ | Max | Units | Conditions | | |
| Operating Current (IDD)⁽²⁾ | | | | | | |
| DC20d | 20 | 30 | mA | -40°C | 3.3V | 10 MIPS ⁽³⁾ |
| DC20a | 19 | 22 | mA | +25°C | | |
| DC20b | 19 | 25 | mA | +85°C | | |
| DC20c | 19 | 30 | mA | +125°C | | |
| DC21d | 28 | 40 | mA | -40°C | 3.3V | 16 MIPS ⁽³⁾ |
| DC21a | 27 | 30 | mA | +25°C | | |
| DC21b | 27 | 32 | mA | +85°C | | |
| DC21c | 27 | 36 | mA | +125°C | | |
| DC22d | 33 | 50 | mA | -40°C | 3.3V | 20 MIPS ⁽³⁾ |
| DC22a | 33 | 40 | mA | +25°C | | |
| DC22b | 33 | 40 | mA | +85°C | | |
| DC22c | 33 | 50 | mA | +125°C | | |
| DC23d | 44 | 60 | mA | -40°C | 3.3V | 30 MIPS ⁽³⁾ |
| DC23a | 43 | 50 | mA | +25°C | | |
| DC23b | 42 | 55 | mA | +85°C | | |
| DC23c | 41 | 65 | mA | +125°C | | |
| DC24d | 55 | 75 | mA | -40°C | 3.3V | 40 MIPS |
| DC24a | 54 | 65 | mA | +25°C | | |
| DC24b | 52 | 70 | mA | +85°C | | |
| DC24c | 51 | 80 | mA | +125°C | | |

Note 1: Data in "Typical" column is at 3.3V, 25°C unless otherwise stated.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows: OSC1 driven with external square wave from rail to rail. All I/O pins are configured as inputs and pulled to Vss. $\overline{\text{MCLR}} = V_{\text{DD}}$, WDT and FSCM are disabled. CPU, SRAM, program memory and data memory are operational. No peripheral modules are operating; however, every peripheral is being clocked (PMD bits are all zeroed).

3: These parameters are characterized, but are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-6: DC CHARACTERISTICS: IDLE CURRENT (IDLE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|--|------------------------|-----|---|------------|--------------------------------|
| Parameter No. | Typical ⁽¹⁾ | Max | Units | Conditions | |
| Idle Current (IDLE): Core OFF Clock ON Base Current⁽²⁾ | | | | | |
| DC40d | 7 | 20 | mA | -40°C | 3.3V 10 MIPS ⁽³⁾ |
| DC40a | 6 | 7 | mA | +25°C | |
| DC40b | 6 | 10 | mA | +85°C | |
| DC40c | 6 | 20 | mA | +125°C | |
| DC41d | 10 | 20 | mA | -40°C | 3.3V 16 MIPS ⁽³⁾ |
| DC41a | 8 | 9 | mA | +25°C | |
| DC41b | 8 | 10 | mA | +85°C | |
| DC41c | 8 | 20 | mA | +125°C | 3.3V 20 MIPS ⁽³⁾ |
| DC42d | 11 | 20 | mA | -40°C | |
| DC42a | 10 | 10 | mA | +25°C | |
| DC42b | 10 | 12 | mA | +85°C | |
| DC42c | 10 | 20 | mA | +125°C | 3.3V 30 MIPS ⁽³⁾ |
| DC43d | 14 | 25 | mA | -40°C | |
| DC43a | 13 | 14 | mA | +25°C | |
| DC43b | 13 | 15 | mA | +85°C | |
| DC43c | 13 | 25 | mA | +125°C | 3.3V 40 MIPS |
| DC44d | 14 | 25 | mA | -40°C | |
| DC44a | 17 | 20 | mA | +25°C | |
| DC44b | 17 | 20 | mA | +85°C | |
| DC44c | 18 | 30 | mA | +125°C | |

Note 1: Data in "Typical" column is at 3.3V, 25°C unless otherwise stated.

Note 2: Base IDLE current is measured with core off, clock on and all modules turned off. Peripheral Module Disable SFR registers are zeroed. All I/O pins are configured as inputs and pulled to Vss.

Note 3: These parameters are characterized, but are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|---|------------------------|-----|---|------------|---|
| Parameter No. | Typical ⁽¹⁾ | Max | Units | Conditions | |
| Power-Down Current (IPD)⁽²⁾ | | | | | |
| DC60d | 55 | 500 | μA | -40°C | 3.3V Base Power-Down Current ^(3,4) |
| DC60a | 63 | 300 | μA | +25°C | |
| DC60b | 85 | 350 | μA | +85°C | |
| DC60c | 146 | 600 | μA | +125°C | |
| DC61d | 8 | 15 | μA | -40°C | 3.3V Watchdog Timer Current: ΔI _{WDT} ^(3,5) |
| DC61a | 2 | 3 | μA | +25°C | |
| DC61b | 2 | 2 | μA | +85°C | |
| DC61c | 3 | 5 | μA | +125°C | |

Note 1: Data in the Typical column is at 3.3V, 25°C unless otherwise stated.

2: Base IPD is measured with all peripherals and clocks shut down. All I/Os are configured as inputs and pulled to V_{SS}. WDT, etc., are all switched off, and VREGS (RCON<8>) = 1.

3: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.

4: These currents are measured on the device containing the most memory in this family.

5: These parameters are characterized, but are not tested in manufacturing.

TABLE 22-8: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | |
|--------------------|--------------------------|-----|---|-------|---------------------|
| Parameter No. | Typical ^(1,2) | Max | Doze Ratio | Units | Conditions |
| DC73a | 41 | 51 | 1:2 | mA | -40°C 3.3V 40 MIPS |
| DC73f | 20 | 28 | 1:64 | | |
| DC73g | 19 | 24 | 1:128 | | |
| DC70a | 40 | 46 | 1:2 | mA | +25°C 3.3V 40 MIPS |
| DC70f | 18 | 20 | 1:64 | | |
| DC70g | 18 | 20 | 1:128 | | |
| DC71a | 40 | 46 | 1:2 | mA | +85°C 3.3V 40 MIPS |
| DC71f | 18 | 25 | 1:64 | | |
| DC71g | 18 | 20 | 1:128 | | |
| DC72a | 39 | 55 | 1:2 | mA | +125°C 3.3V 40 MIPS |
| DC72f | 18 | 30 | 1:64 | | |
| DC72g | 18 | 25 | 1:128 | | |

Note 1: Data in the Typical column is at 3.3V, 25°C unless otherwise stated.

2: Parameters with Doze ratios of 1:2 and 1:64 are characterized, but are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|----------|--|---|--------------------|--------------|---------------|---|
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| | V_{IL} | Input Low Voltage | | | | | |
| DI10 | | I/O pins | V_{SS} | — | $0.2 V_{DD}$ | V | |
| DI15 | | $\overline{\text{MCLR}}$ | V_{SS} | — | $0.2 V_{DD}$ | V | |
| DI16 | | I/O Pins with OSC1 or SOSCI | V_{SS} | — | $0.2 V_{DD}$ | V | |
| DI18 | | SDAx, SCLx | V_{SS} | — | $0.3 V_{DD}$ | V | SMbus disabled |
| DI19 | | SDAx, SCLx | V_{SS} | — | 0.8 | V | SMbus enabled |
| | V_{IH} | Input High Voltage | | | | | |
| DI20 | | I/O Pins Not 5V Tolerant ⁽⁴⁾ | $0.7 V_{DD}$ | — | V_{DD} | V | — |
| | | I/O Pins 5V Tolerant ⁽⁴⁾ | $0.7 V_{DD}$ | — | 5.5 | V | |
| DI28 | | SDAx, SCLx | $0.7 V_{DD}$ | — | 5.5 | V | SMbus disabled |
| DI29 | | SDAx, SCLx | 2.1 | — | 5.5 | V | SMbus enabled |
| | ICNPU | CNx Pull-up Current | | | | | |
| DI30 | | | 50 | 250 | 400 | μA | $V_{DD} = 3.3\text{V}$, $V_{PIN} = V_{SS}$ |
| | I_{IL} | Input Leakage Current^(2,3) | | | | | |
| DI50 | | I/O Pins 5V Tolerant ⁽⁴⁾ | — | — | ± 2 | μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$, Pin at high-impedance |
| DI51 | | I/O Pins Not 5V Tolerant ⁽⁴⁾ | — | — | ± 1 | μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$, Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ |
| DI51a | | I/O Pins Not 5V Tolerant ⁽⁴⁾ | — | — | ± 2 | μA | Shared with external refer- ence pins, $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ |
| DI51b | | I/O Pins Not 5V Tolerant ⁽⁴⁾ | — | — | ± 3.5 | μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$, Pin at high-impedance, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ |
| DI51c | | I/O Pins Not 5V Tolerant ⁽⁴⁾ | — | — | ± 8 | μA | Analog pins shared with external reference pins, $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ |
| DI55 | | $\overline{\text{MCLR}}$ | — | — | ± 2 | μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$ |
| DI56 | | OSC1 | — | — | ± 2 | μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$, XT and HS modes |

Note 1: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

- 2:** The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** See “Pin Diagrams” for a list of digital-only and analog pins.
- 5:** V_{IL} source < ($V_{SS} - 0.3$). Characterized but not tested.
- 6:** Non-5V tolerant pins V_{IH} source > ($V_{DD} + 0.3$), 5V tolerant pins V_{IH} source > 5V or devices with USB, “D+” and “D-“ V_{IH} source > ($V_{USB} + 0.3$). Characterized but not tested.
- 7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5V.
- 8:** Injection currents > |0| can affect the ADC results by approximately 4-6 counts.
- 9:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS (CONTINUED)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended | | | | |
|--------------------|-------------------|--|---|--------------------|-----------------------|-------|---|
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| DI60a | I _{ICL} | Input Low Injection Current | 0 | — | -5 ^(5,8) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , M _{CLR} , V _{CAP} , S _{OSCI} , S _{OSCO} , and RB14 |
| DI60b | I _{ICH} | Input High Injection Current | 0 | — | +5 ^(6,7,8) | mA | All pins except V _{DD} , V _{SS} , AV _{DD} , AV _{SS} , M _{CLR} , V _{CAP} , S _{OSCI} , S _{OSCO} , RB14, and digital 5V-tolerant designated pins |
| DI60c | ΣI _{ICT} | Total Input Injection Current (sum of all I/O and control pins) | -20 ⁽⁹⁾ | — | +20 ⁽⁹⁾ | mA | Absolute instantaneous sum of all ± input injection currents from all I/O pins (I _{ICL} + I _{ICH}) ≤ ΣI _{ICT} |

- Note 1:** Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.
- 2:** The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.
- 3:** Negative current is defined as current sourced by the pin.
- 4:** See “[Pin Diagrams](#)” for a list of digital-only and analog pins.
- 5:** V_{IL} source < (V_{SS} – 0.3). Characterized but not tested.
- 6:** Non-5V tolerant pins V_{IH} source > (V_{DD} + 0.3), 5V tolerant pins V_{IH} source > 5V or devices with USB, “D+” and “D-“ V_{IH} source > (V_{USB} + 0.3). Characterized but not tested.
- 7:** Digital 5V tolerant pins cannot tolerate any “positive” input injection current from input sources > 5V.
- 8:** Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.
- 9:** Any number and/or combination of I/O pins not excluded under I_{ICL} or I_{ICH} conditions are permitted provided the mathematical “absolute instantaneous” sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-10: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|--|---|-----|-----|--------|--|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| DO10 DO16 | VOL | Output Low Voltage I/O ports OSC2/CLKO | — | — | 0.4 | V | IOL = 2mA, VDD = 3.3V IOL = 2mA, VDD = 3.3V |
| DO20 DO26 | VOH | Output High Voltage I/O ports OSC2/CLKO | 2.40 2.41 | — | — | V V | IOH = -2.3 mA, VDD = 3.3V IOH = -1.3 mA, VDD = 3.3V |

TABLE 22-11: ELECTRICAL CHARACTERISTICS: BOR

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|--------|---|---|-----|------|-------|------------|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| BO10 | VBOR | BOR Event on VDD transition high-to-low BOR event is tied to VDD core voltage decrease | 2.40 | — | 2.55 | V | — |

Note 1: Parameters are for design guidance only and are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-12: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|-----------------------------|--------|-----------------------------------|---|--------------------|------|-------|--|
| Param No. | Symbol | Characteristic ⁽³⁾ | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| Program Flash Memory | | | | | | | |
| D130 | EP | Cell Endurance | 10,000 | — | — | E/W | -40°C to +125°C |
| D131 | VPR | VDD for Read | V _{MIN} | — | 3.6 | V | V _{MIN} = Minimum operating voltage |
| D132B | VPEW | VDD for Self-Timed Write | V _{MIN} | — | 3.6 | V | V _{MIN} = Minimum operating voltage |
| D134 | TRETD | Characteristic Retention | 20 | — | — | Year | Provided no other specifications are violated, -40°C to +125°C |
| D135 | IDDP | Supply Current during Programming | — | 10 | — | mA | |
| D136a | TRW | Row Write Time | 1.32 | — | 1.74 | ms | TRW = 11064 FRC cycles, TA = +85°C, See Note 2 |
| D136b | TRW | Row Write Time | 1.28 | — | 1.79 | ms | TRW = 11064 FRC cycles, TA = +125°C, See Note 2 |
| D137a | TPE | Page Erase Time | 20.1 | — | 26.5 | ms | TPE = 168517 FRC cycles, TA = +85°C, See Note 2 |
| D137b | TPE | Page Erase Time | 19.5 | — | 27.3 | ms | TPE = 168517 FRC cycles, TA = +125°C, See Note 2 |
| D138a | TWW | Word Write Cycle Time | 42.3 | — | 55.9 | μs | TWW = 355 FRC cycles, TA = +85°C, See Note 2 |
| D138b | TWW | Word Write Cycle Time | 41.1 | — | 57.6 | μs | TWW = 355 FRC cycles, TA = +125°C, See Note 2 |

Note 1: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

2: Other conditions: FRC = 7.37 MHz, TUN<5:0> = b' 011111 (for Min), TUN<5:0> = b' 100000 (for Max). This parameter depends on the FRC accuracy (see [Table 22-18](#)) and the value of the FRC Oscillator Tuning register (see [Register 8-4](#)). For complete details on calculating the Minimum and Maximum time see [Section 5.3 “Programming Operations”](#).

3: These parameters are assured by design, but are not characterized or tested in manufacturing.

TABLE 22-13: INTERNAL VOLTAGE REGULATOR SPECIFICATIONS

| Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | | | |
|---|--------|---------------------------------|-----|-----|-----|-------|--|
| Param No. | Symbol | Characteristics | Min | Typ | Max | Units | Comments |
| | CEFC | External Filter Capacitor Value | 4.7 | 10 | — | μF | Capacitor must be low series resistance (< 5 ohms) |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

22.2 AC Characteristics and Timing Parameters

The information contained in this section defines dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 AC characteristics and timing parameters.

TABLE 22-14: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

| | |
|---------------------------|--|
| AC CHARACTERISTICS | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) |
| | Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ for Industrial $-40^{\circ}\text{C} \leq T_A \leq +125^{\circ}\text{C}$ for Extended Operating voltage V_{DD} range as described in Table 22-1 . |

FIGURE 22-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

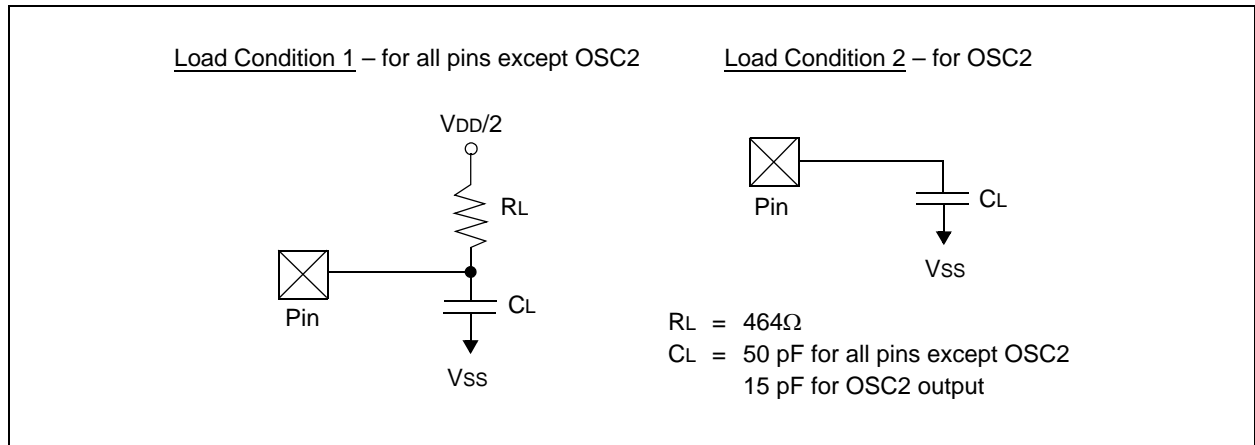

TABLE 22-15: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
|-----------|--------|-----------------------|-----|-----|-----|-------|--|
| DO50 | Cosc2 | OSC2/SOSC2 pin | — | — | 15 | pF | In XT and HS modes when external clock is used to drive OSC1 |
| DO56 | Cio | All I/O pins and OSC2 | — | — | 50 | pF | EC mode |
| DO58 | CB | SCLx, SDAx | — | — | 400 | pF | In I ² C™ mode |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

FIGURE 22-2: EXTERNAL CLOCK TIMING

TABLE 22-16: EXTERNAL CLOCK TIMING REQUIREMENTS

| AC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | |
|--------------------|---------------|--|---|--------------------|----------------|-------------------|--------------------------|
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| OS10 | FIN | External CLKI Frequency ⁽⁴⁾ (External clocks allowed only in EC and ECPLL modes) | DC | — | 40 | MHz | EC |
| | | Oscillator Crystal Frequency ⁽⁵⁾ | 3.5 10 | — — — | 10 40 33 | MHz MHz kHz | XT HS SOSC |
| OS20 | Tosc | Tosc = 1/Fosc ⁽⁴⁾ | 12.5 | — | DC | ns | — |
| OS25 | Tcy | Instruction Cycle Time ^(2,4) | 25 | — | DC | ns | — |
| OS30 | TosL, TosH | External Clock in (OSC1) ⁽⁵⁾ High or Low Time | 0.375 x Tsc | — | 0.625 x Tsc | ns | EC |
| OS31 | TosR, TosF | External Clock in (OSC1) ⁽⁵⁾ Rise or Fall Time | — | — | 20 | ns | EC |
| OS40 | TckR | CLKO Rise Time ^(3,5) | — | 5.2 | — | ns | — |
| OS41 | TckF | CLKO Fall Time ^(3,5) | — | 5.2 | — | ns | — |
| OS42 | GM | External Oscillator Transconductance ⁽⁶⁾ | 14 | 16 | 18 | mA/V | VDD = 3.3V TA = +25°C |

Note 1: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

2: Instruction cycle period (Tcy) equals two times the input oscillator time-base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits can result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “min.” values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the “max.” cycle time limit is “DC” (no clock) for all devices.

3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.

4: These parameters are characterized by similarity, but are tested in manufacturing at FIN = 40 MHz only.

5: These parameters are characterized by similarity, but are not tested in manufacturing.

6: Data for this parameter is preliminary. This parameter is characterized, but is not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 22-17: PLL CLOCK TIMING SPECIFICATIONS (V_{DD} = 3.0V TO 3.6V)

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|--------------------|--------|--|-----|--------------------|-----|-------|-----------------------------|
| Param No. | Symbol | Characteristic | Min | Typ ⁽¹⁾ | Max | Units | Conditions |
| OS50 | FPLLI | PLL Voltage Controlled Oscillator (VCO) Input Frequency Range ⁽²⁾ | 0.8 | — | 8 | MHz | ECPLL, XTPLL modes |
| OS51 | FSYS | On-Chip VCO System Frequency ⁽³⁾ | 100 | — | 200 | MHz | — |
| OS52 | TLOCK | PLL Start-up Time (Lock Time) ⁽³⁾ | 0.9 | 1.5 | 3.1 | ms | — |
| OS53 | DCLK | CLKO Stability (Jitter) ⁽³⁾ | -3 | 0.5 | 3 | % | Measured over 100 ms period |

Note 1: Data in “Typ” column is at 3.3V, 25°C unless otherwise stated.

2: These parameters are characterized by similarity, but are tested in manufacturing at 7.7 MHz input only.

3: These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. To calculate the effective jitter for individual time bases or communication clocks use this formula:

$$\text{Peripheral Clock Jitter} = \frac{DCLK}{\sqrt{\left(\frac{FOSC}{\text{Peripheral Bit Rate Clock}}\right)}}$$

For example: Fosc = 32 MHz, DCLK = 3%, SPI bit rate clock, (i.e., SCK) is 2 MHz.

$$\text{SPI SCK Jitter} = \left[\frac{DCLK}{\sqrt{\left(\frac{32 \text{ MHz}}{2 \text{ MHz}}\right)}} \right] = \left[\frac{3\%}{\sqrt{16}} \right] = \left[\frac{3\%}{4} \right] = 0.75\%$$

TABLE 22-18: AC CHARACTERISTICS: INTERNAL RC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|---|----------------|--|-----|-----|-------|---------------------|----------------------------|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| Internal FRC Accuracy @ FRC Frequency = 7.37 MHz⁽¹⁾ | | | | | | | |
| F20a | FRC | -2 | — | +2 | % | -40°C ≤ TA ≤ +85°C | V _{DD} = 3.0-3.6V |
| F20b | FRC | -5 | — | +5 | % | -40°C ≤ TA ≤ +125°C | V _{DD} = 3.0-3.6V |

Note 1: Frequency calibrated at 25°C and 3.3V. TUN bits can be used to compensate for temperature drift.

TABLE 22-19: INTERNAL RC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | | | |
|--|----------------|--|-----|-----|-------|--------------------|----------------------------|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| LPRC @ 32.768 kHz^(1,2) | | | | | | | |
| F21a | LPRC | -15 | ±6 | +15 | % | -40°C ≤ TA ≤ +85°C | V _{DD} = 3.0-3.6V |

Note 1: Change of LPRC frequency as V_{DD} changes.

2: LPRC impacts the Watchdog Timer Time-out Period (TWDT1). See [Section 19.4 “Watchdog Timer \(WDT\)”](#) for more information.

TABLE 22-37: I2Cx BUS DATA TIMING REQUIREMENTS (SLAVE MODE)

| AC CHARACTERISTICS | | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended | | | |
|--------------------|---------|-------------------------------|---------------------------|---|------|-------|---|
| Param | Symbol | Characteristic ⁽²⁾ | | Min | Max | Units | Conditions |
| IS10 | TLO:SCL | Clock Low Time | 100 kHz mode | 4.7 | — | μs | Device must operate at a minimum of 1.5 MHz |
| | | | 400 kHz mode | 1.3 | — | μs | Device must operate at a minimum of 10 MHz |
| | | | 1 MHz mode ⁽¹⁾ | 0.5 | — | μs | — |
| IS11 | THI:SCL | Clock High Time | 100 kHz mode | 4.0 | — | μs | Device must operate at a minimum of 1.5 MHz |
| | | | 400 kHz mode | 0.6 | — | μs | Device must operate at a minimum of 10 MHz |
| | | | 1 MHz mode ⁽¹⁾ | 0.5 | — | μs | — |
| IS20 | TF:SCL | SDAx and SCLx Fall Time | 100 kHz mode | — | 300 | ns | CB is specified to be from 10 to 400 pF |
| | | | 400 kHz mode | 20 + 0.1 CB | 300 | ns | |
| | | | 1 MHz mode ⁽¹⁾ | — | 100 | ns | |
| IS21 | TR:SCL | SDAx and SCLx Rise Time | 100 kHz mode | — | 1000 | ns | CB is specified to be from 10 to 400 pF |
| | | | 400 kHz mode | 20 + 0.1 CB | 300 | ns | |
| | | | 1 MHz mode ⁽¹⁾ | — | 300 | ns | |
| IS25 | TSU:DAT | Data Input Setup Time | 100 kHz mode | 250 | — | ns | — |
| | | | 400 kHz mode | 100 | — | ns | |
| | | | 1 MHz mode ⁽¹⁾ | 100 | — | ns | |
| IS26 | THD:DAT | Data Input Hold Time | 100 kHz mode | 0 | — | μs | — |
| | | | 400 kHz mode | 0 | 0.9 | μs | |
| | | | 1 MHz mode ⁽¹⁾ | 0 | 0.3 | μs | |
| IS30 | TSU:STA | Start Condition Setup Time | 100 kHz mode | 4.7 | — | μs | Only relevant for Repeated Start condition |
| | | | 400 kHz mode | 0.6 | — | μs | |
| | | | 1 MHz mode ⁽¹⁾ | 0.25 | — | μs | |
| IS31 | THD:STA | Start Condition Hold Time | 100 kHz mode | 4.0 | — | μs | After this period, the first clock pulse is generated |
| | | | 400 kHz mode | 0.6 | — | μs | |
| | | | 1 MHz mode ⁽¹⁾ | 0.25 | — | μs | |
| IS33 | TSU:STO | Stop Condition Setup Time | 100 kHz mode | 4.7 | — | μs | — |
| | | | 400 kHz mode | 0.6 | — | μs | |
| | | | 1 MHz mode ⁽¹⁾ | 0.6 | — | μs | |
| IS34 | THD:STO | Stop Condition Hold Time | 100 kHz mode | 4000 | — | ns | — |
| | | | 400 kHz mode | 600 | — | ns | |
| | | | 1 MHz mode ⁽¹⁾ | 250 | — | ns | |
| IS40 | TAA:SCL | Output Valid From Clock | 100 kHz mode | 0 | 3500 | ns | — |
| | | | 400 kHz mode | 0 | 1000 | ns | |
| | | | 1 MHz mode ⁽¹⁾ | 0 | 350 | ns | |
| IS45 | TBF:SDA | Bus Free Time | 100 kHz mode | 4.7 | — | μs | Time the bus must be free before a new transmission can start |
| | | | 400 kHz mode | 1.3 | — | μs | |
| | | | 1 MHz mode ⁽¹⁾ | 0.5 | — | μs | |
| IS50 | CB | Bus Capacitive Loading | | — | 400 | pF | — |

Note 1: Maximum pin capacitance = 10 pF for all I2Cx pins (for 1 MHz mode only).

2: These parameters are characterized by similarity, but not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

23.0 HIGH TEMPERATURE ELECTRICAL CHARACTERISTICS

This section provides an overview of dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 electrical characteristics for devices operating in an ambient temperature range of -40°C to +150°C.

Note: Programming of the Flash memory is not allowed above 125°C.

The specifications between -40°C to +150°C are identical to those shown in [Section 22.0 “Electrical Characteristics”](#) for operation between -40°C to +125°C, with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, parameter DC10 in [Section 22.0 “Electrical Characteristics”](#) is the Industrial and Extended temperature equivalent of HDC10.

Absolute maximum ratings for the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 high temperature devices are listed below. Exposure to these maximum rating conditions for extended periods can affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

Absolute Maximum Ratings⁽¹⁾

| | |
|---|-----------------------|
| Ambient temperature under bias ⁽⁴⁾ | -40°C to +150°C |
| Storage temperature | -65°C to +160°C |
| Voltage on VDD with respect to VSS | -0.3V to +4.0V |
| Voltage on any pin that is not 5V tolerant with respect to VSS ⁽⁵⁾ | -0.3V to (VDD + 0.3V) |
| Voltage on any 5V tolerant pin with respect to VSS when VDD < 3.0V ⁽⁵⁾ | -0.3V to 3.6V |
| Voltage on any 5V tolerant pin with respect to VSS when VDD ≥ 3.0V ⁽⁵⁾ | -0.3V to 5.6V |
| Voltage on VCAP with respect to VSS | 2.25V to 2.75V |
| Maximum current out of VSS pin | 60 mA |
| Maximum current into VDD pin ⁽²⁾ | 60 mA |
| Maximum junction temperature | +155°C |
| Maximum output current sunk by any I/O pin ⁽³⁾ | 1 mA |
| Maximum output current sourced by any I/O pin ⁽³⁾ | 1 mA |
| Maximum current sunk by all ports combined | 10 mA |
| Maximum current sourced by all ports combined ⁽²⁾ | 10 mA |

Note 1: Stresses above those listed under “Absolute Maximum Ratings” can cause permanent damage to the device. This is a stress rating only, and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods can affect device reliability.

2: Maximum allowable current is a function of device maximum power dissipation (see [Table 23-2](#)).

3: Unlike devices at 125°C and below, the specifications in this section also apply to the CLKOUT, VREF+, VREF-, SCLx, SDAX, PGCx, and PGDx pins.

4: AEC-Q100 reliability testing for devices intended to operate at 150°C is 1,000 hours. Any design in which the total operating time from 125°C to 150°C will be greater than 1,000 hours is not warranted without prior written approval from Microchip Technology Inc.

5: Refer to the “[Pin Diagrams](#)” section for 5V tolerant pins.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

23.1 High Temperature DC Characteristics

TABLE 23-1: OPERATING MIPS VS. VOLTAGE

| Characteristic | VDD Range (in Volts) | Temperature Range (in °C) | Max MIPS |
|----------------|-------------------------|------------------------------|--|
| | | | dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 |
| | 3.0V to 3.6V | -40°C to +150°C | 20 |

TABLE 23-2: THERMAL OPERATING CONDITIONS

| Rating | Symbol | Min | Typ | Max | Unit |
|--|--------|---------------------------|-----|------|------|
| High Temperature Devices | | | | | |
| Operating Junction Temperature Range | TJ | -40 | — | +155 | °C |
| Operating Ambient Temperature Range | TA | -40 | — | +150 | °C |
| Power Dissipation: Internal chip power dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \sum I_{OH})$ I/O Pin Power Dissipation: $I/O = \sum (\{V_{DD} - V_{OH}\} \times I_{OH}) + \sum (V_{OL} \times I_{OL})$ | PD | PINT + PI/O | | | W |
| Maximum Allowed Power Dissipation | PDMAX | $(T_J - T_A)/\theta_{JA}$ | | | W |

TABLE 23-3: DC TEMPERATURE AND VOLTAGE SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^\circ\text{C} \leq T_A \leq +150^\circ\text{C}$ for High Temperature | | | | |
|--------------------------|-----------------------|----------------|---|-----|-----|-------|-----------------|
| Parameter No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| Operating Voltage | | | | | | | |
| HDC10 | Supply Voltage | | | | | | |
| | VDD | — | 3.0 | 3.3 | 3.6 | V | -40°C to +150°C |

TABLE 23-4: DC CHARACTERISTICS: POWER-DOWN CURRENT (IPD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^\circ\text{C} \leq T_A \leq +150^\circ\text{C}$ for High Temperature | | | |
|---|---------|------|---|------------|------|---|
| Parameter No. | Typical | Max | Units | Conditions | | |
| Power-Down Current (IPD)⁽³⁾ | | | | | | |
| HDC60e | 250 | 2000 | μA | +150°C | 3.3V | Base Power-Down Current ^(1,3) |
| HDC61c | 3 | 5 | μA | +150°C | 3.3V | Watchdog Timer Current: ΔI_{WDT} ^(2,4) |

Note 1: Base IPD is measured with all peripherals and clocks shut down. All I/Os are configured as inputs and pulled to Vss. WDT, etc., are all switched off, and VREGS (RCON<8>) = 1.

2: The Δ current is the additional current consumed when the module is enabled. This current should be added to the base IPD current.

3: These currents are measured on the device containing the most memory in this family.

4: These parameters are characterized, but are not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 23-5: DC CHARACTERISTICS: DOZE CURRENT (IDD)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | |
|--|------------------------|-----|---|------------|------|---------|
| Parameter No. | Typical ⁽¹⁾ | Max | Units | Conditions | | |
| Operating Current (IPD)⁽¹⁾ | | | | | | |
| HDC20 | 19 | 35 | mA | +150°C | 3.3V | 10 MIPS |
| HDC21 | 27 | 45 | mA | +150°C | 3.3V | 16 MIPS |
| HDC22 | 33 | 55 | mA | +150°C | 3.3V | 20 MIPS |

Note 1: These parameters are characterized, but are not tested in manufacturing.

TABLE 23-6: DC CHARACTERISTICS: DOZE CURRENT (IDOZE)

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | |
|--------------------|------------------------|-----|---|-------|------------|------|
| Parameter No. | Typical ⁽¹⁾ | Max | Doze Ratio | Units | Conditions | |
| HDC72a | 39 | 45 | 1:2 | mA | +150°C | 3.3V |
| HDC72f | 18 | 25 | 1:64 | mA | | |
| HDC72g | 18 | 25 | 1:128 | mA | | |

Note 1: Parameters with Doze ratios of 1:2 and 1:64 are characterized, but are not tested in manufacturing.

TABLE 23-7: DC CHARACTERISTICS: I/O PIN OUTPUT SPECIFICATIONS

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|----------------------------|---|-----|-----|-------|-------------------------|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| HDO10 HDO16 | VOL | Output Low Voltage | | | | | |
| | | I/O ports | — | — | 0.4 | V | IOL = 1 mA, VDD = 3.3V |
| | | OSC2/CLKO | — | — | 0.4 | V | IOL = 1 mA, VDD = 3.3V |
| HDO20 HDO26 | VOH | Output High Voltage | | | | | |
| | | I/O ports | 2.40 | — | — | V | IOH = -1 mA, VDD = 3.3V |
| | | OSC2/CLKO | 2.41 | — | — | V | IOH = -1 mA, VDD = 3.3V |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 23-8: DC CHARACTERISTICS: PROGRAM MEMORY

| DC CHARACTERISTICS | | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | |
|--------------------|--------|---|---|-----|-----|-------|--|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| HD130 | EP | Program Flash Memory Cell Endurance | 10,000 | — | — | E/W | -40°C to $+150^{\circ}\text{C}$ ⁽²⁾ |
| HD134 | TRETD | Characteristic Retention | 20 | — | — | Year | 1000 E/W cycles or less and no other specifications are violated |

Note 1: These parameters are assured by design, but are not characterized or tested in manufacturing.

2: Programming of the Flash memory is not allowed above 125°C .

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

23.2 AC Characteristics and Timing Parameters

The information contained in this section defines dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 AC characteristics and timing parameters for high temperature devices. However, all AC timing specifications in this section are the same as those in [Section 22.2 “AC Characteristics and Timing Parameters”](#), with the exception of the parameters listed in this section.

Parameters in this section begin with an H, which denotes High temperature. For example, parameter OS53 in [Section 22.2 “AC Characteristics and Timing Parameters”](#) is the Industrial and Extended temperature equivalent of HOS53.

TABLE 23-9: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

| | |
|---------------------------|--|
| AC CHARACTERISTICS | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature Operating voltage V_{DD} range as described in Table 23-1 . |
|---------------------------|--|

FIGURE 23-1: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

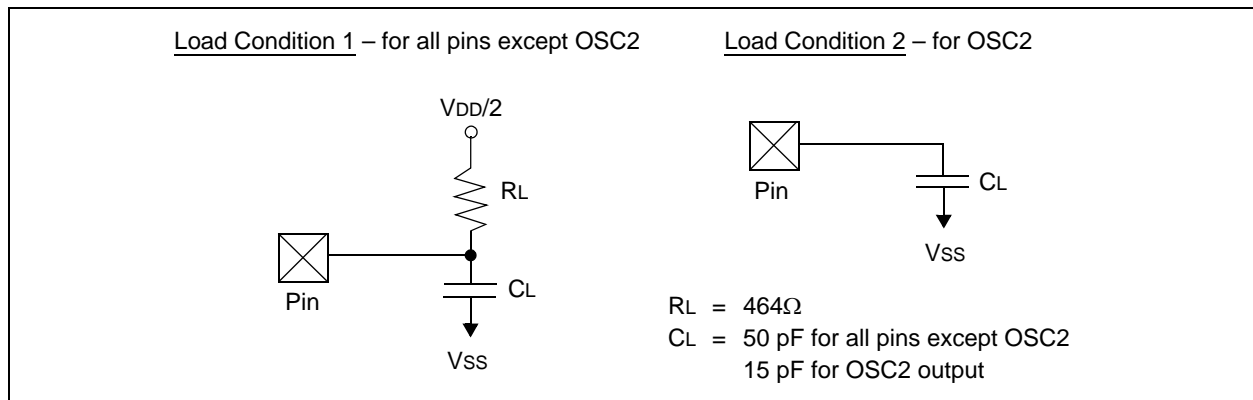

TABLE 23-10: PLL CLOCK TIMING SPECIFICATIONS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|---------------------------|--------|---|-----|-----|-----|-------|-----------------------------|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| HOS53 | DCLK | CLKO Stability (Jitter) ⁽¹⁾ | -5 | 0.5 | 5 | % | Measured over 100 ms period |

Note 1: These parameters are characterized by similarity, but are not tested in manufacturing. This specification is based on clock cycle by clock cycle measurements. To calculate the effective jitter for individual time bases or communication clocks use this formula::

$$\text{Peripheral Clock Jitter} = \frac{DCLK}{\sqrt{\left(\frac{FOSC}{\text{Peripheral Bit Rate Clock}}\right)}}$$

For example: $F_{osc} = 32 \text{ MHz}$, $DCLK = 5\%$, SPI bit rate clock, (i.e., SCK) is 2 MHz.

$$\text{SPI SCK Jitter} = \left[\frac{DCLK}{\sqrt{\left(\frac{32 \text{ MHz}}{2 \text{ MHz}}\right)}} \right] = \left[\frac{5\%}{\sqrt{16}} \right] = \left[\frac{5\%}{4} \right] = 1.25\%$$

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 23-11: SPIx MASTER MODE (CKE = 0) TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|--------------------|-----------------------|--|-----|-----|-----|-------|------------|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| HSP35 | Tsch2doV, TscL2doV | SDOx Data Output Valid after SCKx Edge | — | 10 | 25 | ns | — |
| HSP40 | TdiV2sch, TdiV2scL | Setup Time of SDIx Data Input to SCKx Edge | 28 | — | — | ns | — |
| HSP41 | Tsch2diL, TscL2diL | Hold Time of SDIx Data Input to SCKx Edge | 35 | — | — | ns | — |

Note 1: These parameters are characterized but not tested in manufacturing.

TABLE 23-12: SPIx MODULE MASTER MODE (CKE = 1) TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|--------------------|-----------------------|--|-----|-----|-----|-------|------------|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| HSP35 | Tsch2doV, TscL2doV | SDOx Data Output Valid after SCKx Edge | — | 10 | 25 | ns | — |
| HSP36 | TdoV2sc, TdoV2scL | SDOx Data Output Setup to First SCKx Edge | 35 | — | — | ns | — |
| HSP40 | TdiV2sch, TdiV2scL | Setup Time of SDIx Data Input to SCKx Edge | 28 | — | — | ns | — |
| HSP41 | Tsch2diL, TscL2diL | Hold Time of SDIx Data Input to SCKx Edge | 35 | — | — | ns | — |

Note 1: These parameters are characterized but not tested in manufacturing.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 23-13: SPIx MODULE SLAVE MODE (CKE = 0) TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|--------------------|-----------------------|--|-----|-----|-----|-------|------------|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| HSP35 | Tsch2doV, TscL2doV | SDOx Data Output Valid after SCKx Edge | — | — | 35 | ns | — |
| HSP40 | TdiV2sch, TdiV2scL | Setup Time of SDIx Data Input to SCKx Edge | 25 | — | — | ns | — |
| HSP41 | Tsch2diL, TscL2diL | Hold Time of SDIx Data Input to SCKx Edge | 25 | — | — | ns | — |
| HSP51 | TssH2doZ | $\overline{\text{SSx}}$ \uparrow to SDOx Output High-Impedance | 15 | — | 55 | ns | See Note 2 |

Note 1: These parameters are characterized but not tested in manufacturing.

2: Assumes 50 pF load on all SPIx pins.

TABLE 23-14: SPIx MODULE SLAVE MODE (CKE = 1) TIMING REQUIREMENTS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|--------------------|-----------------------|--|-----|-----|-----|-------|------------|
| Param No. | Symbol | Characteristic ⁽¹⁾ | Min | Typ | Max | Units | Conditions |
| HSP35 | Tsch2doV, TscL2doV | SDOx Data Output Valid after SCKx Edge | — | — | 35 | ns | — |
| HSP40 | TdiV2sch, TdiV2scL | Setup Time of SDIx Data Input to SCKx Edge | 25 | — | — | ns | — |
| HSP41 | Tsch2diL, TscL2diL | Hold Time of SDIx Data Input to SCKx Edge | 25 | — | — | ns | — |
| HSP51 | TssH2doZ | $\overline{\text{SSx}}$ \uparrow to SDOx Output High-Impedance | 15 | — | 55 | ns | See Note 2 |
| HSP60 | TssL2doV | SDOx Data Output Valid after $\overline{\text{SSx}}$ Edge | — | — | 55 | ns | — |

Note 1: These parameters are characterized but not tested in manufacturing.

2: Assumes 50 pF load on all SPIx pins.

TABLE 23-15: INTERNAL RC ACCURACY

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for Extended | | | | | |
|--------------------|------------------------------------|--|-----|-----|-------|--|-----------------------------------|
| Param No. | Characteristic | Min | Typ | Max | Units | Conditions | |
| | LPRC @ 32.768 kHz ^(1,2) | | | | | | |
| HF21 | LPRC | -70 | — | +70 | % | $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ | $V_{DD} = 3.0\text{-}3.6\text{V}$ |

Note 1: Change of LPRC frequency as VDD changes.

2: LPRC accuracy impacts the Watchdog Timer Time-out Period (TWDT1). See [Section 19.4 “Watchdog Timer \(WDT\)”](#) for more information.

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE 23-16: ADC MODULE SPECIFICATIONS

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|-------------------------|--------|--|-----|-----|-----|---------------|----------------------------------|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |
| Reference Inputs | | | | | | | |
| HAD08 | IREF | Current Drain | — | 250 | 600 | μA | ADC operating, See Note 1 |
| | | | — | — | 50 | μA | ADC off, See Note 1 |

Note 1: These parameters are not characterized or tested in manufacturing.

2: These parameters are characterized, but are not tested in manufacturing.

TABLE 23-17: ADC MODULE SPECIFICATIONS (12-BIT MODE)⁽³⁾

| AC CHARACTERISTICS | | Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature $-40^{\circ}\text{C} \leq T_A \leq +150^{\circ}\text{C}$ for High Temperature | | | | | |
|--|--------|--|--------------|-----|-----|-------|---|
| Param No. | Symbol | Characteristic | Min | Typ | Max | Units | Conditions |

24.0 PACKAGING INFORMATION

24.1 Package Marking Information

28-Lead SPDIP

Example

28-Lead SOIC

Example

28-Lead SSOP

Example

| | | |
|----------------|--|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| | (e3) | Pb-free JEDEC designator for Matte Tin (Sn) |
| | * (e3) | This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package. |
| Note: | If the full Microchip part number cannot be marked on one line, it is carried over to the next line, thus limiting the number of available characters for customer-specific information. | |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

24.1 Package Marking Information (Continued)

28-Lead QFN-S

Example

44-Lead QFN

Example

44-Lead TQFP

Example

| | | |
|----------------|--------|--|
| Legend: | XX...X | Customer-specific information |
| | Y | Year code (last digit of calendar year) |
| | YY | Year code (last 2 digits of calendar year) |
| | WW | Week code (week of January 1 is week '01') |
| | NNN | Alphanumeric traceability code |
| | (e3) | Pb-free JEDEC designator for Matte Tin (Sn) |
| | * | This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package. |

Note: If the full Microchip part number cannot be marked on one line, it is carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

APPENDIX A: REVISION HISTORY

Revision A (July 2007)

Initial release of this document.

Revision B (June 2008)

This revision includes minor typographical and formatting changes throughout the data sheet text.

The major changes are referenced by their respective section in the following table.

TABLE A-1: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|--|
| “High-Performance, 16-bit Digital Signal Controllers” | Added Extended Interrupts column to Remappable Peripherals in the Controller Families table and Note 2 (see Table 1). Added Note 1 to all pin diagrams, which references RPn pin usage by remappable peripherals (see “Pin Diagrams”). |
| Section 1.0 “Device Overview” | Changed PORTA pin name from RA15 to RA10 (see Table 1-1). |
| Section 3.0 “Memory Organization” | Added SFR definitions (ACCAL, ACCAH, ACCAU, ACCBL, ACCBH, and ACCBU) to the CPU Core Register Map (see Table 3-1). Updated Reset value for CORCON (see Table 3-1). Updated Reset values for the following SFRs: IPC1, IPC3-IPC5, IPC7, IPC16 and INTTREG (see Table 3-4). Updated the Reset value for CLKDIV in the System Control Register Map (see Table 3-20). |
| Section 6.0 “Resets” | Entire section was replaced to maintain consistency with other dsPIC33F data sheets. |
| Section 7.0 “Oscillator Configuration” | Removed the first sentence of the third clock source item (External Clock) in Section 7.1.1.2 “Primary” . Updated the default bit values for DOZE and FRCDIV in the Clock Divisor Register (see Register 7-2). Added the center frequency in the OSCTUN register for the FRC Tuning bits (TUN<5:0>) value 011111 and updated the center frequency for bits value 011110 (see Register 7-4). |
| Section 8.0 “Power-Saving Features” | Added the following two registers: <ul style="list-style-type: none">• PMD1: Peripheral Module Disable Control Register 1• PMD2: Peripheral Module Disable Control Register 2 |
| Section 9.0 “I/O Ports” | Added paragraph and Table 9-1 to Section 9.1.1 “Open-Drain Configuration” , which provides details on I/O pins and their functionality. Removed the following sections, which are now available in the related section of the dsPIC33F/PIC24H Family Reference Manual: <ul style="list-style-type: none">• 9.4.2 “Available Peripherals”• 9.4.3.3 “Mapping”• 9.4.5 “Considerations for Peripheral Pin Selection” |
| Section 13.0 “Output Compare” | Replaced sections 13.1, 13.2 and 13.3 and related figures and tables with entirely new content. |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|--|
| Section 14.0 “Serial Peripheral Interface (SPI)” | <p>Removed the following sections, which are now available in the related section of the dsPIC33F/PIC24H Family Reference Manual:</p> <ul style="list-style-type: none"> • 14.1 “Interrupts” • 14.2 “Receive Operations” • 14.3 “Transmit Operations” • 14.4 “SPI Setup” (retained Figure 14-1: SPI Module Block Diagram) |
| Section 15.0 “Inter-Integrated Circuit (I²C™)” | <p>Removed the following sections, which are now available in the related section of the dsPIC33F/PIC24H Family Reference Manual:</p> <ul style="list-style-type: none"> • 15.3 “I²C Interrupts” • 15.4 “Baud Rate Generator” (retained Figure 15-1: I²C Block Diagram) • 15.5 “I²C Module Addresses” • 15.6 “Slave Address Masking” • 15.7 “IPMI Support” • 15.8 “General Call Address Support” • 15.9 “Automatic Clock Stretch” • 15.10 “Software Controlled Clock Stretching (STREN = 1)” • 15.11 “Slope Control” • 15.12 “Clock Arbitration” • 15.13 “Multi-Master Communication, Bus Collision, and Bus Arbitration” • 15.14 “Peripheral Pin Select Limitations” |
| Section 16.0 “Universal Asynchronous Receiver Transmitter (UART)” | <p>Removed the following sections, which are now available in the related section of the dsPIC33F/PIC24H Family Reference Manual:</p> <ul style="list-style-type: none"> • 16.1 “UART Baud Rate Generator” • 16.2 “Transmitting in 8-bit Data Mode” • 16.3 “Transmitting in 9-bit Data Mode” • 16.4 “Break and Sync Transmit Sequence” • 16.5 “Receiving in 8-bit or 9-bit Data Mode” • 16.6 “Flow Control Using \overline{UxCTS} and \overline{UxRTS} Pins” • 16.7 “Infrared Support” <p>Removed IrDA references and Note 1, and updated the bit and bit value descriptions for UTXINV (UxSTA<14>) in the UARTx Status and Control Register (see Register 16-2).</p> |
| Section 17.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)” | <p>Removed Equation 17-1: ADC Conversion Clock Period and Figure 17-2: ADC Transfer Function (10-Bit Example).</p> <p>Added ADC1 Module Block Diagram for dsPIC33FJ16GP304 and dsPIC33FJ32GP204 Devices (Figure 18-1) and ADC1 Module Block Diagram FOR dsPIC33FJ32GP202 Devices (Figure 17-2).</p> <p>Added Note 2 to Figure 17-3: ADC Conversion Clock Period Block Diagram.</p> <p>Added device-specific information to Note 1 in the ADC1 Input Scan Select Register Low (see Register 17-6), and updated the default bit value for bits 12-10 (CSS12-CSS10) from U-0 to R/W-0.</p> <p>Added device-specific information to Note 1 in the ADC1 Port Configuration Register Low (see Register 17-7), and updated the default bit value for bits 12-10 (PCFG12-PCFG10) from U-0 to R/W-0.</p> |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE A-1: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|--|
| Section 18.0 “Special Features” | <p>Added FICD register information for address 0xF8000E in the Device Configuration Register Map (see Table 18-1).</p> <p>Added FICD register content (BKBUG, COE, JTAGEN, and ICS<1:0> to the dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304 Configuration Bits Description (see Table 18-2).</p> <p>Added a note regarding the placement of low-ESR capacitors, after the second paragraph of Section 18.2 “On-Chip Voltage Regulator” and to Figure 18-1.</p> <p>Removed the words “if enabled” from the second sentence in the fifth paragraph of Section 18.3 “BOR: Brown-Out Reset”.</p> |
| Section 21.0 “Electrical Characteristics” | <p>Updated Max MIPS value for -40°C to +125°C temperature range in Operating MIPS vs. Voltage (see Table 21-1).</p> <p>Removed Typ value for parameter DC12 (see Table 22-4).</p> <p>Updated MIPS conditions for parameters DC24c, DC44c, DC72a, DC72f and DC72g (see Table 21-5, Table 21-6 and Table 21-8).</p> <p>Added Note 4 (reference to new table containing digital-only and analog pin information to I/O Pin Input Specifications (see Table 21-9).</p> <p>Updated Typ, Min, and Max values for Program Memory parameters D136, D137, and D138 (see Table 21-12).</p> <p>Updated Max value for Internal RC Accuracy parameter F21 for -40°C ≤ TA ≤ +125°C condition and added Note 2 (see Table 21-19).</p> <p>Removed all values for Reset, Watchdog Timer, Oscillator Start-up Timer, and Power-up Timer parameter SY20 and updated conditions, which now refers to Section 18.4 “Watchdog Timer (WDT)” and LPRC parameter F21a (see Table 21-21).</p> <p>Updated Min and Typ values for parameters AD60, AD61, AD62 and AD63 and removed Note 3 (see Table 21-37).</p> <p>Updated Min and Typ values for parameters AD60, AD61, AD62 and AD63 and removed Note 3 (see Table 21-38).</p> |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Revision C (December 2008)

This revision includes minor typographical and formatting changes throughout the data sheet text.

The major changes are referenced by their respective section in the following table.

TABLE A-2: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|---|
| “High-Performance, 16-bit Digital Signal Controllers” | Updated all pin diagrams to denote the pin voltage tolerance (see “ Pin Diagrams ”). |
| Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers” | Added new section to the data sheet that provides guidelines on getting started with 16-bit Digital Signal Controllers. |
| Section 10.0 “I/O Ports” | Updated 5V tolerant status for I/O pin RB4 from Yes to No (see Table 10-1). |
| Section 22.0 “Electrical Characteristics” | <p>Removed the maximum value for parameter DC12 (RAM Data Retention Voltage) in Table 22-4.</p> <p>Updated typical values for Operating Current (IDD) and added Note 3 in Table 22-5.</p> <p>Updated typical and maximum values for Idle Current (IDLE): Core OFF Clock ON Base Current and added Note 3 in Table 22-6.</p> <p>Updated typical and maximum values for Power Down Current (IPD) and added Note 5 in Table 22-7.</p> <p>Updated typical and maximum values for Doze Current (IDOZE) and added Note 2 in Table 22-8.</p> <p>Added Note 3 to Table 22-12.</p> <p>Updated minimum value for Internal Voltage Regulator Specifications in Table 22-13.</p> <p>Added parameter OS42 (GM) and Notes 4, 5, and 6 to Table 22-16.</p> <p>Added Notes 2 and 3 to Table 22-17.</p> <p>Added Note 2 to Table 22-20.</p> <p>Added Note 2 to Table 22-21.</p> <p>Added Note 2 to Table 22-22.</p> <p>Added Note 1 to Table 22-23.</p> <p>Added Note 1 to Table 22-24.</p> <p>Added Note 3 to Table 22-32.</p> <p>Added Note 2 to Table 22-33.</p> <p>Updated typical value for parameter AD08 (ADC in operation) and added Notes 2 and 3 in Table 22-34.</p> <p>Updated minimum, typical, and maximum values for parameters AD23a, AD24a, AD30a, AD32a, AD32a, and AD34a, and added Notes 2 and 3 in Table 22-35.</p> <p>Updated minimum, typical, and maximum values for parameters AD23b, AD24b, AD30b, AD32b, AD32b, and AD34b, and added Notes 2 and 3 in Table 22-36.</p> |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Revision D (October 2009)

This revision includes minor typographical and formatting changes throughout the data sheet text.

Global changes include:

- Changed all instances of OSC1 to OSC1 and OSC0 to OSC2.
- Changed all instances of PGCx/EMUCx and PGDx/EMUDx (where x = 1, 2 or 3) to PGECx and PGEDx.

Changed all instances of VDDCORE and VDDCORE/VCAP to VCAP/VDDCORE

All other major changes are referenced by their respective section in the following table.

TABLE A-3: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|--|
| “High-Performance, 16-bit Digital Signal Controllers” | Added Note 2 to the 28-Pin QFN-S and 44-Pin QFN pin diagrams, which references pin connections to Vss. |
| Section 8.0 “Oscillator Configuration” | Updated the Oscillator System Diagram (see Figure 8-1). Added Note 1 to the Oscillator Tuning (OSCTUN) register (see Register 8-4). |
| Section 10.0 “I/O Ports” | Removed Table 10-1 and added reference to pin diagrams for I/O pin availability and functionality. |
| Section 15.0 “Serial Peripheral Interface (SPI)” | Added Note 2 to the SPIx Control Register 1 (see Register 15-2). |
| Section 17.0 “Universal Asynchronous Receiver Transmitter (UART)” | Updated the UTXINV bit settings in the UxSTA register and added Note 1 (see Register 17-2). |
| Section 22.0 “Electrical Characteristics” | Updated the Min value for parameter DC12 (RAM Retention Voltage) and added Note 4 to the DC Temperature and Voltage Specifications (see Table 22-4). Updated the Min value for parameter DI35 (see Table 22-20). Updated AD08 and added reference to Note 2 for parameters AD05a, AD06a and AD08a (see Table 22-34). |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Revision E (November 2009)

The revision includes the following global update:

- Added Note 2 to the shaded table that appears at the beginning of each chapter. This new note provides information regarding the availability of registers and their associated bits

This revision also includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-4: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|---|
| “High-Performance, 16-bit Digital Signal Controllers” | Added information on high temperature operation (see “Operating Range:”). |
| Section 10.0 “I/O Ports” | Changed the reference to digital-only pins to 5V tolerant pins in the second paragraph of Section 10.2 “Open-Drain Configuration”. |
| Section 17.0 “Universal Asynchronous Receiver Transmitter (UART)” | Updated the two baud rate range features to: 10 Mbps to 38 bps at 40 MIPS. |
| Section 18.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)” | Updated the ADC1 block diagrams (see Figure 18-1 and Figure 18-2). |
| Section 19.0 “Special Features” | Updated the second paragraph and removed the fourth paragraph in Section 19.1 “Configuration Bits”. Updated the Device Configuration Register Map (see Table 19-1). |
| Section 22.0 “Electrical Characteristics” | Updated the Absolute Maximum Ratings for high temperature and added Note 4. Updated the SPIx Module Slave Mode (CKE = 1) Timing Characteristics (see Figure 22-12). Updated the Internal RC Accuracy parameter numbers (see Table 22-18 and Table 22-19). |
| Section 23.0 “High Temperature Electrical Characteristics” | Added new chapter with high temperature specifications. |
| “Product Identification System” | Added the “H” definition for high temperature. |

Revision F (November 2009)

This revision includes minor typographical and formatting changes throughout the data sheet text.

All other major changes are referenced by their respective section in the following table.

TABLE A-5: MAJOR SECTION UPDATES

| Section Name | Update Description |
|---|---|
| “High-Performance, 16-bit Digital Signal Controllers” | Updated MIPS rating from 16 to 20 for high temperature devices in “Operating Range:” and in TABLE 22-1: “Operating MIPS vs. Voltage”. |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Revision G (January 2011)

This revision includes typographical and formatting changes throughout the data sheet text. In addition, all instances of VDDCORE have been removed.

All other major changes are referenced by their respective section in the following table.

TABLE A-6: MAJOR SECTION UPDATES

| Section Name | Update Description |
|--|--|
| High-Performance, 16-bit Digital Signal Controllers | Added the SSOP package information (see “Packaging:” , Table 1 , and “Pin Diagrams”). |
| Section 2.0 “Guidelines for Getting Started with 16-bit Digital Signal Controllers” | Updated the title of Section 2.3 “CPU Logic Filter Capacitor Connection (Vcap)” . The frequency limitation for device PLL start-up conditions was updated in Section 2.7 “Oscillator Value Conditions on Device Start-up” . The second paragraph in Section 2.9 “Unused I/Os” was updated. |
| Section 3.0 “CPU” | Removed references to DMA in the CPU Core Block Diagram (see Figure 3-1). |
| Section 4.0 “Memory Organization” | Updated the data memory reference in the third paragraph in Section 4.2 “Data Address Space” . The All Resets values for the following SFRs in the Timer Register Map were changed (see Table 4-5): <ul style="list-style-type: none">• TMR1• TMR2• TMR3 |
| Section 8.0 “Oscillator Configuration” | Added Note 3 to the OSCCON: Oscillator Control Register (see Register 8-1). Added Note 2 to the CLKDIV: Clock Divisor Register (see Register 8-2). Added Note 1 to the PLLFBD: PLL Feedback Divisor Register (see Register 8-3). Added Note 2 to the OSCTUN: FRC Oscillator Tuning Register (see Register 8-4). |
| Section 18.0 “10-bit/12-bit Analog-to-Digital Converter (ADC)” | Updated the VREFL references in the ADC1 module block diagrams (see Figure 18-1 and Figure 18-2). |
| Section 19.0 “Special Features” | Added a new paragraph and removed the third paragraph in Section 19.1 “Configuration Bits” . Added the column “RTSP Effects” to the Configuration Bits Descriptions (see Table 19-2). |
| Section 24.0 “Packaging Information” | Added the 28-Lead SSOP package information (see Section 24.1 “Package Marking Information” and Section 24.2 “Package Details”). |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

TABLE A-6: MAJOR SECTION UPDATES (CONTINUED)

| Section Name | Update Description |
|--|---|
| <p>Section 22.0 “Electrical Characteristics”</p> | <p>Added the 28-pin SSOP Thermal Packaging Characteristics (see Table 22-3).</p> <p>Removed Note 4 from the DC Temperature and Voltage Specifications (see Table 22-4).</p> <p>Updated the maximum value for parameters DI18 and DI19 and added parameters DI28, DI29, DI60a, DI60b, and DI60c to the I/O Pin Input Specifications (see Table 22-9).</p> <p>Updated Note 3 in the PLL Clock Timing Specifications (see Table 22-17).</p> <p>Removed Note 2 from the AC Characteristics: Internal RC Accuracy (see Table 22-18).</p> <p>Updated the characteristic description for parameter DI35 in the I/O Timing Requirements (see Table 22-20).</p> <p>Updated all SPI specifications (see Table 22-28 through Table 22-35 and Figure 22-10 through Figure 22-16).</p> <p>Added Note 4 to the 12-bit mode ADC Module Specifications (see Table 22-39).</p> <p>Added Note 4 to the 10-bit mode ADC Module Specifications (see Table 22-40).</p> |
| <p>Section 23.0 “High Temperature Electrical Characteristics”</p> | <p>Updated all ambient temperature end range values to +150°C throughout the chapter.</p> <p>Updated the storage temperature end range to +160°C.</p> <p>Updated the maximum junction temperature from +145°C to +155°C.</p> <p>Updated Note 1 in the PLL Clock Timing Specifications (see Table 23-10).</p> <p>Added Note 3 to the 12-bit Mode ADC Module Specifications (see Table 23-17).</p> <p>Added Note 3 to the 10-bit Mode ADC Module Specifications (see Table 23-18).</p> |
| <p>“Product Identification System”</p> | <p>Added the “SS” definition for the SSOP package.</p> |

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://support.microchip.com>

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

TO: Technical Publications Manager Total Pages Sent _____

RE: Reader Response

From: Name _____

Company _____

Address _____

City / State / ZIP / Country _____

Telephone: (_____) _____ - _____ FAX: (_____) _____ - _____

Application (optional):

Would you like a reply? ___ Y ___ N

Device: dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

Literature Number: DS70290G

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this document easy to follow? If not, why?

4. What additions to the document do you think would enhance the structure and subject?

5. What deletions from the document could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

dsPIC33FJ32GP202/204 and dsPIC33FJ16GP304

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.
