

## 3-Phase Sinusoidal Sensorless Brushless Motor Driver

### Features

- 180° Sinusoidal Drive for High Efficiency and Low Acoustic Noise
- Position Sensorless BLDC Drivers (no Hall Effect Sensor required)
- Integrated Power Transistors
- Supports 2V to 5.5V Power Supplies
- Programming Resistor ( $R_{PROG}$ ) Settings to Fit Motor Constant ( $K_M$ ) Range from 3.25 mV/Hz to 52 mV/Hz
- Direction Control:
  - Forward direction: connect DIR pin to GND or leave floating
  - Reverse direction: connect DIR pin to  $V_{BIAS}$  or 3V
- Speed Control through Power Supply Modulation (PSM) and/or Pulse-Width Modulation (PWM)
- Built-in Frequency Generator (FG Output Signal)
- Built-in Lockup Protection and Automatic Recovery Circuit
- Built-in Overcurrent Limitation
- Built-in Thermal Shutdown Protection
- Built-in Overvoltage Protection
- No External Tuning Required
- Available Package:
  - 10-Lead 3mm x 3mm UDFN

### Applications

- Notebook CPU Cooling Fans
- 5V 3-Phase BLDC

### Description

The MTD6505 device is a 3-phase, full-wave sensorless driver for brushless DC (BLDC) motors. It features 180° sinusoidal drive, high-torque output and silent drive. With the adaptive features, parameters and wide range of power supplies (2V to 5.5V), the MTD6505 is intended to cover a broad range of motor characteristics, while requiring minimum external components. Speed control can be achieved through either PSM or PWM.

The compact packaging and the minimal bill of materials make the MTD6505 device extremely cost-efficient in fan applications. For example, the CPU cooling fans in notebook computers require designs that provide low acoustic noise, low mechanical vibration, and are highly efficient. The frequency generator (FG) output enables precision speed control in closed-loop applications.

The MTD6505 device includes Lockup Protection mode to turn off the output current when the motor is in a lock condition, with an automatic recovery feature to restart the fan when the lock condition is removed. Motor overcurrent limitation and thermal shutdown protection are included for safety-enhanced operations.

The MTD6505 is available in a compact, thermally-enhanced, 10-lead 3 mm x 3 mm UDFN package.

### Package Types

# MTD6505

## Functional Block Diagram

## Typical Application

### Recommended External Components for Typical Application

Element	Type/Value	Comment
C1	$\geq 1 \mu\text{F}$	Connect as close as possible to IC input pins
C2	$\geq 1 \mu\text{F}$	Connect as close as possible to IC input pins
R1	$\geq 10 \text{ k}\Omega$	Connect to $V_{\text{LOGIC}}$ on microcontroller side (FG Pull-Up)
R2	3.9 k $\Omega$ or 24 k $\Omega$	Select appropriate programming resistor value, see <a href="#">Table 4-2</a>

# MTD6505

NOTES:

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings†

Power Supply Voltage ( $V_{DD\_MAX}$ )	-0.7 to +7.0V
Maximum Output Voltage ( $V_{OUT\_MAX}$ )	-0.7 to +7.0V
Maximum Output Current <sup>(1)</sup> ( $I_{OUT\_MAX}$ )	1000 mA
FG Maximum Output Voltage ( $V_{FG\_MAX}$ )	-0.7 to +7.0V
FG Maximum Output Current ( $I_{FG\_MAX}$ )	5.0 mA
$V_{BIAS}$ Maximum Voltage ( $V_{BIAS\_MAX}$ )	-0.7 to +4.0V
PWM Maximum Voltage ( $V_{PWM\_MAX}$ )	-0.7 to +7.0V
Allowable Power Dissipation <sup>(2)</sup> ( $P_{D\_MAX}$ )	1.5W
Maximum Junction Temperature ( $T_J$ )	+150°C
ESD protection on all pins	≥2 kV

† **Notice:** Stresses above those listed under “Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**Note 1:**  $I_{OUT}$  is also internally limited, according to the limits defined in the “**Electrical Characteristics**” table.

**2:** Reference Printed Circuit Board (PCB), according to JEDEC standard EIA/JESD 51-9.

### ELECTRICAL CHARACTERISTICS

**Electrical Specifications:** Unless otherwise specified, all limits are established for  $V_{DD} = 2.0V$  to  $5.5V$ ,  $T_A = +25^\circ C$

Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Power Supply Voltage	$V_{DD}$	2	—	5.5	V	
Power Supply Current	$I_{VDD}$	—	5	10	mA	$V_{DD} = 5V$
Standby Current	$I_{VDD\_STB}$	—	30	40	$\mu A$	PWM = 0V, $V_{DD} = 5V$ (Standby mode)
OUTX High Resistance	$R_{ON(H)}$	—	0.75	1.1	$\Omega$	$I_{OUT} = 0.5A$ , $V_{DD} = 5V$ <b>Note 1</b>
OUTX Low Resistance	$R_{ON(L)}$	—	0.75	1.3	$\Omega$	$I_{OUT} = 0.5A$ , $V_{DD} = 5V$ <b>Note 1</b>
OUTX Total Resistance	$R_{ON(H+L)}$	—	1.5	2.4	$\Omega$	$I_{OUT} = 0.5A$ , $V_{DD} = 5V$ <b>Note 1</b>
$V_{BIAS}$ Internal Supply Voltage	$V_{BIAS}$	—	3	—	V	$V_{DD} = 3.2V$ to $5.5V$
		—	$V_{DD} - 0.2$	—	V	$V_{DD} < 3.2V$
PWM Input Frequency	$f_{PWM}$	1	—	100	kHz	
PWM Input H Level	$V_{PWM\_H}$	$0.55 * V_{DD}$	—	$V_{DD}$	V	$V_{DD} \geq 4.5V$
PWM Input L Level	$V_{PWM\_L}$	0	—	$0.2 * V_{DD}$	V	$V_{DD} \geq 4.5V$
PWM Internal Pull-Up Resistor	$R_{PWM\_0}$	—	266	—	k $\Omega$	PWM = 0V
PWM Internal Pull-Up Resistor	$R_{PWM}$	—	133	—	k $\Omega$	PWM duty-cycle > 0%
DIR Input H Level	$V_{DIR\_H}$	$V_{BIAS} - 0.5$	—	$V_{BIAS}$	V	$V_{DD} \geq 4.5V$
DIR Input L Level	$V_{DIR\_L}$	0	—	$0.2 * V_{DD}$	V	$V_{DD} \geq 4.5V$
DIR Internal Pull-Down Resistor	$R_{DIR}$	100	—	200	k $\Omega$	
FG Output Pin Low-Level Voltage	$V_{OL\_FG}$	—	—	0.25	V	$I_{FG} = -1 mA$
FG Output Pin Leakage Current	$I_{LH\_FG}$	-10	—	10	$\mu A$	$V_{FG} = 5.5V$
Lock Protection Operating Time	$T_{RUN}$	—	0.5	—	s	
Lock Protection Waiting Time	$T_{WAIT}$	4.5	5	5.5	s	<b>Note 2</b>
Overcurrent Protection	$I_{OC\_MOT}$	—	750	—	mA	<b>Note 3</b>
Overvoltage Protection	$V_{OV}$	—	7.2	—	V

## ELECTRICAL CHARACTERISTICS (CONTINUED)

Electrical Specifications: Unless otherwise specified, all limits are established for $V_{DD} = 2.0V$ to $5.5V$ , $T_A = +25^\circ C$						
Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
Short Protection on High Side	$I_{OC\_SW\_H}$	—	2.57	—	A	
Short Protection on Low Side	$I_{OC\_SW\_L}$	—	-2.83	—	A	
Thermal Shutdown	$T_{SD}$	—	170	—	$^\circ C$	
Thermal Shutdown Hysteresis	$T_{SD\_HYS}$	—	25	—	$^\circ C$	

- Note 1:** Minimum and maximum parameters are not production tested and are specified by design and validation.
- Note 2:** Related to the internal oscillator frequency (see [Figure 2-1](#)).
- Note 3:** 750 mA is the standard option for MTD6505. Additional overcurrent protection levels are available upon request. Please contact factory for different overcurrent protection values.

## TEMPERATURE SPECIFICATIONS

Electrical Specifications: Unless otherwise specified, all limits are established for $V_{DD} = 2.0V$ to $5.5V$ , $T_A = +25^\circ C$ .						
Parameters	Sym.	Min.	Typ.	Max.	Units	Conditions
<b>Temperature Ranges</b>						
Operating Temperature	$T_{OPR}$	-40	—	+125	$^\circ C$	
Storage Temperature Range	$T_{STG}$	-55	—	+150	$^\circ C$	
<b>Thermal Package Resistances</b>						
Thermal Resistance, 10LD-UDFN 3x3	$\theta_{JA}$	—	96.6	—	$^\circ C/W$	
	$\theta_{JC}$	—	12	—	$^\circ C/W$	

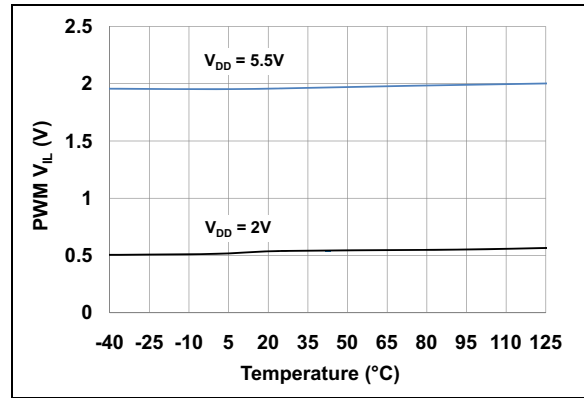

## 2.0 TYPICAL PERFORMANCE CURVES

**Note:** The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

**Note:** Unless indicated,  $T_A = +25^\circ\text{C}$ ,  $V_{DD} = 2.0\text{V}$  to  $5.5\text{V}$ , OUT1, 2, 3 and PWM open.

**FIGURE 2-1:** Oscillator Frequency Deviation vs. Temperature.

**FIGURE 2-4:** Inputs (PWM, DIR)  $V_{IL}$  vs. Temperature.

**FIGURE 2-2:** Internal Regulated Voltage ( $V_{BIAS}$ ) vs. Temperature.

**FIGURE 2-5:** Inputs (PWM, DIR)  $V_{IH}$  vs. Temperature.

**FIGURE 2-3:** Internal Regulated Voltage ( $V_{BIAS}$ ) vs. Supply Voltage ( $V_{DD}$ ).

**FIGURE 2-6:** Outputs  $R_{ON}$  High-Side Resistance vs. Temperature.

**FIGURE 2-9:** Standby Current vs. Temperature.

**FIGURE 2-12:** Typical Outputs on Closed Loop.

## 3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 3-1](#).

**TABLE 3-1: MTD6505 PIN FUNCTION TABLE**

Pin Number	Type	Name	Function
1	O	FG	Motor Speed Indication Output Pin
2	I	R <sub>PROG</sub>	K <sub>M</sub> Parameter Setting with External Resistors Pin, see <a href="#">Table 4-2</a> for values
3	—	V <sub>BIAS</sub>	Internal Regulator Output Pin (for decoupling only)
4	O	OUT1	Single-Phase Coil Output Pin
5	O	OUT2	Single-Phase Coil Output Pin
6	—	GND	Negative Voltage Supply Pin (ground)
7	O	OUT3	Single-Phase Coil Output Pin
8	—	V <sub>DD</sub>	Positive Voltage Supply Pin for Motor Driver
9	I	DIR	Motor Rotation Direction Pin <ul style="list-style-type: none"> <li>- Forward direction: connect this pin to GND or leave floating</li> <li>- Reverse direction: connect this pin to V<sub>BIAS</sub></li> </ul>
10	I	PWM	PWM Input Signal Pin for Speed Control
11	—	EP	Exposed Thermal Pad Pin (Connect to the ground plan for better thermal dissipation)

**Legend:** I = Input; O = Output

# MTD6505

---

NOTES:

## 4.0 FUNCTIONAL DESCRIPTION

The MTD6505 generates a full-wave signal to drive a 3-phase BLDC motor. High efficiency and low power consumption are achieved due to CMOS transistors and synchronous rectification drive type.

### 4.1 Speed Control

The rotational speed of the motor can be controlled either through the PWM digital input signal or by acting directly on the power supply ( $V_{DD}$ ). When the PWM signal is High (or left open), the motor rotates at full speed. When the PWM signal is low, the IC outputs are set to high-impedance and the motor is stopped.

By changing the PWM duty cycle, the speed can be adjusted. Thus, the user has freedom to choose the PWM system frequency within a wide range (from 1 kHz to 100 kHz).

Since the PWM pin has an internal pull-up resistor connected to  $V_{DD}$ , it is recommended to drive it between 0V and high Z. The PWM driver must be able to support the pull-up resistor current to drive the pin. See “PWM Internal Pull-Up Resistor” in [Section 1.0, Electrical Characteristics](#).

The output transistor activation always occurs at a fixed rate of 30 kHz, which is outside the range of audible frequencies.

- Note 1:** The PWM frequency has no direct effect on the motor speed and is asynchronous with the activation of the output transistors.
- 2:** The standard output frequency is 30 kHz. A 20 kHz output frequency option is available upon request.

### 4.2 Motor Rotation Direction

The current-carrying order of the outputs depends on the DIR pin state (“Rotation Direction”) and is illustrated in [Table 4-1](#). The DIR pin is not designed for dynamic direction change during operation.

**TABLE 4-1: MOTOR ROTATION DIRECTION OPTIONS (DIR PIN)**

DIR Pin State	Rotation Direction	Outputs Activation Sequence
Connected to GND or Floating	Forward	OUT1 → OUT2 → OUT3
Connected to $V_{BIAS}$	Reverse	OUT3 → OUT2 → OUT1

### 4.3 Frequency Generator Function

The Frequency Generator output (FG) is a “Hall Effect Sensor equivalent” digital output, giving information to an external controller about the speed and phase of the motor. The FG pin is an open-drain output, connecting to a logical voltage level through an external pull-up resistor. When a lock or an out-of-sync situation is detected by the driver, this output is set to high-impedance until the motor is restarted. Leave the pin open when it is not used.

### 4.4 Lock-Up Protection and Automatic Restart

If the motor is blocked and cannot rotate freely, a lock-up protection circuit detects it and disables the driver by setting its outputs to high-impedance to prevent the motor coil from burnout. After a “waiting time” ( $T_{WAIT}$ ), the lock-up protection is released and normal operation resumes for a given time ( $T_{RUN}$ ). If the motor is still blocked, a new period of waiting time is started.  $T_{WAIT}$  and  $T_{RUN}$  timings are fixed internally, so that no external capacitor is required.

### 4.5 Overcurrent Protection

The motor peak current is limited by the driver to 750 mA (standard value), thus limiting the maximum power dissipation in the coils.

### 4.6 Thermal Shutdown

The MTD6505 device has a thermal protection function which detects when the die temperature exceeds  $T_J = +170^{\circ}\text{C}$ . When this temperature is reached, the circuit enters Thermal Shutdown mode, and outputs OUT1, OUT2 and OUT3 are disabled (high-impedance), avoiding IC destruction and allowing the circuit to cool down. When the junction temperature ( $T_J$ ) drops below  $+145^{\circ}\text{C}$ , normal operation resumes.

The thermal detection circuit has  $+25^{\circ}\text{C}$  hysteresis.

**FIGURE 4-1: Thermal Protection Hysteresis.**

# MTD6505

## 4.7 Overvoltage Shutdown

The MTD6505 device has an overvoltage protection function which detects when the  $V_{DD}$  voltage exceeds  $V_{OV} = +7.2V$ . When this temperature is reached, the circuit enters Thermal Shutdown mode and outputs OUT1, OUT2 and OUT3 are disabled (high-impedance).

## 4.8 Internal Voltage Regulator

$V_{BIAS}$  voltage is generated internally and is used to supply internal logical blocks. The  $V_{BIAS}$  pin is used to connect an external decoupling capacitor (1  $\mu F$  or higher). Notice that this pin is for IC internal use, and is not designed to supply DC current to external blocks.

## 4.9 Back Electromotive Force (BEMF) Coefficient Setting

$K_M$  is the electro-mechanical coupling coefficient of the motor (also referred to as “motor constant” or “BEMF constant”). Depending on the conventions in use, the exact definition of  $K_M$  and its measurement criteria can vary among motor manufacturers. To accommodate various motor applications, the MTD6505 provides options to facilitate diverse BEMF coefficients.

The MTD6505 defines BEMF coefficient ( $K_M$ ) as the peak value of the phase-to-phase BEMF voltage, normalized to the electrical speed of the motor. The following table offers methods to set the  $K_M$  value for the MTD6505 device.

TABLE 4-2:  $K_M$  SETTINGS

$K_M$ Option	$K_M$ (mV/Hz) Range Phase-to-Phase		$R_{PROG}$
	Min.	Max.	
$K_{M0}$	3.25	6.5	GND
$K_{M1}$	6.5	13	24 k $\Omega$
$K_{M2}$	13	26	3.9 k $\Omega$
$K_{M3}$	26	52	$V_{BIAS}$

The  $R_{PROG}$  sensing is actually a sequence that is controlled by the firmware. For any given  $R_{PROG}$ , the internal control block will output the corresponding  $K_M$  range.

## 4.10 Defining the Correct $R_{PROG}$ Value

This section explains how to define the correct  $K_M$  value for a specific fan. The  $K_M$  is linked to the  $R_{PROG}$  (see Table 4-2). An incorrect  $K_M$  selection can create issues or reduce efficiency.

### 4.10.1 OPERATION

Follow the next steps to define the right  $R_{PROG}$  value:

1. Apply a constant stream of air to a fan that is not connected.
2. Using an oscilloscope, measure the waveform between two phases when the fan is rotating.
3. Measure the generated peak-to-peak voltage ( $V_{P-P}$ ) value and the frequency (f).
4. Compute  $K_M$  based on the measured  $V_{P-P}$  and f (in mV/Hz):

### EQUATION 4-1: $K_M$ COMPUTE

$$K_M = \frac{V_{P-P}}{2f}$$

$K_M$  should be constant for all fan rotation speeds; but, for the  $K_M$  measurement, the fan rotation speed (due to the air stream) should be close to nominal.

**Note:** This is a theoretical procedure that does not take care of the harmonics generated by the BEMF. This information has to be taken for indication only.

## 5.0 PACKAGING INFORMATION

### 5.1 Package Marking Information

10-Lead UDFN (3x3x0.5 mm)

Device	Code
MTD6505T-E/NA	AAAD

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC® designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

## APPENDIX A: REVISION HISTORY

### Revision C (December 2014)

The following is the list of modifications:

1. Changed the title of the document.
2. Changed the minimum and maximum values for DIR Input H Level in the [Electrical Characteristics](#) table.
3. Updated [Section 4.0 “Functional Description”](#). Added new [Section 4.7 “Overvoltage Shutdown”](#).
4. Minor editorial corrections.

### Revision B (October 2013)

The following is the list of modifications:

1. Updated the [Absolute Maximum Ratings†](#) section with the correct  $V_{BIAS}$  parameter.
2. Updated the Thermal Resistance values in the [Temperature Specifications](#) table.
3. Added [Figure 2-11](#) and [Figure 2-12](#).
4. Added [Section 4.10 “Defining the Correct RPROG Value”](#).
5. Minor grammatical and editorial corrections.

### Revision A (November 2011)

- This is the original release of this document.

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
