PHOTO ENLARGEMENT**DESCRIPTION**

The TriQuint TGA8310 - SCC is a monolithic low - noise distributed amplifier, which operates from 2 to 20- GHz. Noise figure is typically 4 - dB. Nine 122- μm gatewidth FETs typically provide 17.5-dBm of output power at 1- dB gain compression and 9- dB typical small signal gain. Typical input return loss is 17-dB from 2 to 20-GHz. Typical output return loss is 20-dB. Ground is provided to the circuitry through vias to the backside metallization.

The TGA8310 - SCC low - noise distributed amplifier is suitable for a variety of wide - band electronic warfare systems such as radar warning receivers, electronic counter-measures, decoys, jammers, and phased array systems.

Bond pad and backside metallization is gold plated for compatibility with eutectic alloy attachment methods as well as the thermocompression and thermosonic wire- bonding processes. The TGA8310 - SCC is supplied in chip form and is readily assembled using automated equipment.

Ratings over operating channel temperature range, T_{CH} (unless otherwise noted)

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “RF Characteristics” is not implied. Exposure to absolute maximum rated conditions for extended periods may affect device reliability.

* For operation above 25 °C base-plate temperature, derate linearly at the rate of 5.5 mW/ °C.

**Operating channel temperature directly affects the device MTF. For maximum life, it is recommended that channel temperature be maintained at the lowest possible level.
