

## 125 kHz Passive RFID Device with Sensor Input

### Features

- External sensor input
- Data polarity changes with sensor input condition
- Read-only data transmission
- 96- or 128-bits of factory programming user memory (also supports 48- and 64-bit protocols)
- Operates up to 400 kHz carrier frequency
- Low-power operation
- Modulation options:
  - ASK, FSK, PSK
- Data Encoding options:
  - NRZ Direct, Differential Biphase Manchester Biphase
- Die, Wafer, PDIP or SOIC package option
- Factory programming and device serialization

### Applications

- Insect control
- Industrial tagging

### Package Type

| PDIP/SOIC  |                     |
|------------|---------------------|
| VA □ 1     | 8 □ V <sub>B</sub>  |
| NC □ 2     | 7 □ NC              |
| TEST □ 3   | 6 □ V <sub>SS</sub> |
| SENSOR □ 4 | 5 □ V <sub>CC</sub> |

### Description

The MCRF202 is a passive Radio Frequency Identification (RFID) device that provides an RF interface for reading the contents of a user memory array. This device is specially designed to detect the logic state of an external sensor, and alters its data transmissions, based on the condition of the sensor input. The device outputs a normal bit data stream if the sensor input has a logic '1' state, but outputs an inverted data stream for a logic '0' state. In this way, the reader can monitor the state (condition) of the external sensor input by detecting whether the data from the device is a normal or inverted data stream.

The device is powered by rectifying the incoming RF carrier signal that is transmitted from the reader. When the device develops sufficient DC voltage, it transmits the contents of its memory array by modulating the incoming RF carrier signal. The reader is able to detect the modulation and decodes the data being transmitted. Code length, modulation option, encoding option, and bit rate are set at the factory to fit the needs of particular applications.

The MCRF202 is available in die, wafer, PDIP and SOIC packages. The encoding, modulation, bit rate options, and data fields are specified by the customer and programmed by Microchip Technology Inc. prior to shipment. See Technical Bulletin TB023 for more information on factory serialization (SQTP™).

# MCRF202

## Block Diagram

## 1.0 ELECTRICAL CHARACTERISTICS

### 1.1 Absolute Maximum Ratings<sup>(†)</sup>

Storage temperature ..... - 65°C to +150°C

Ambient temperature with power applied.....-40°C to +125°C

Maximum current into coil pads ..... 50 mA

† **NOTICE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

**TABLE 1-1: AC AND DC CHARACTERISTICS**

| Parameter   | Sym  | Min | Typ | Max  | Units | Conditions                                    |
|---|------|-----|-----|------|-------|---|

# MCRF202

## 2.0 FUNCTIONAL DESCRIPTION

The device contains three major building blocks. They are RF front-end and sensor input, configuration and control logic, and memory sections. The Block Diagram is shown on page 1.

### 2.1 RF Front-End and Sensor Input

The RF front-end of the device includes circuits for rectification of the carrier, VDD (operating voltage), and high-voltage clamping to prevent excessive voltage from being applied to the device. This section also generates a system clock from the incoming carrier signal and modulates the carrier signal to transmit data to the reader.

#### 2.1.1 RECTIFIER – AC CLAMP

The AC voltage generated by the external tuned LC circuit is full wave rectified. This unregulated voltage is used as the maximum DC supply voltage for the rest of the device and for the VCC supply to the external sensor or switch. Any excessive voltage on the tuned circuit is clamped by the internal circuitry to a safe level to prevent damage to the IC.

#### 2.1.2 MODULATION CIRCUIT

The MCRF202 sends the encoded data to the reader by AM-modulating the coil voltage across the tuned LC circuit. A modulation transistor is placed between the antenna coil pads (VA and VB). The transistor turns on and off based on the modulation signal. As a result, the amplitude of the antenna coil voltage varies with the modulation signal. See Figure 2-1 for details.

#### 2.1.3 VCC REGULATOR

The device generates a DC supply voltage from the unregulated coil voltage. The Vcc pin can be used to power a separate low-current device (read range will be affected).

#### 2.1.4 CLOCK GENERATOR

This circuit generates a clock based on the carrier frequency from the reader. This clock is used to derive all timing in the MCRF202, including the baud rate and modulation rate.

#### 2.1.5 POWER-ON RESET

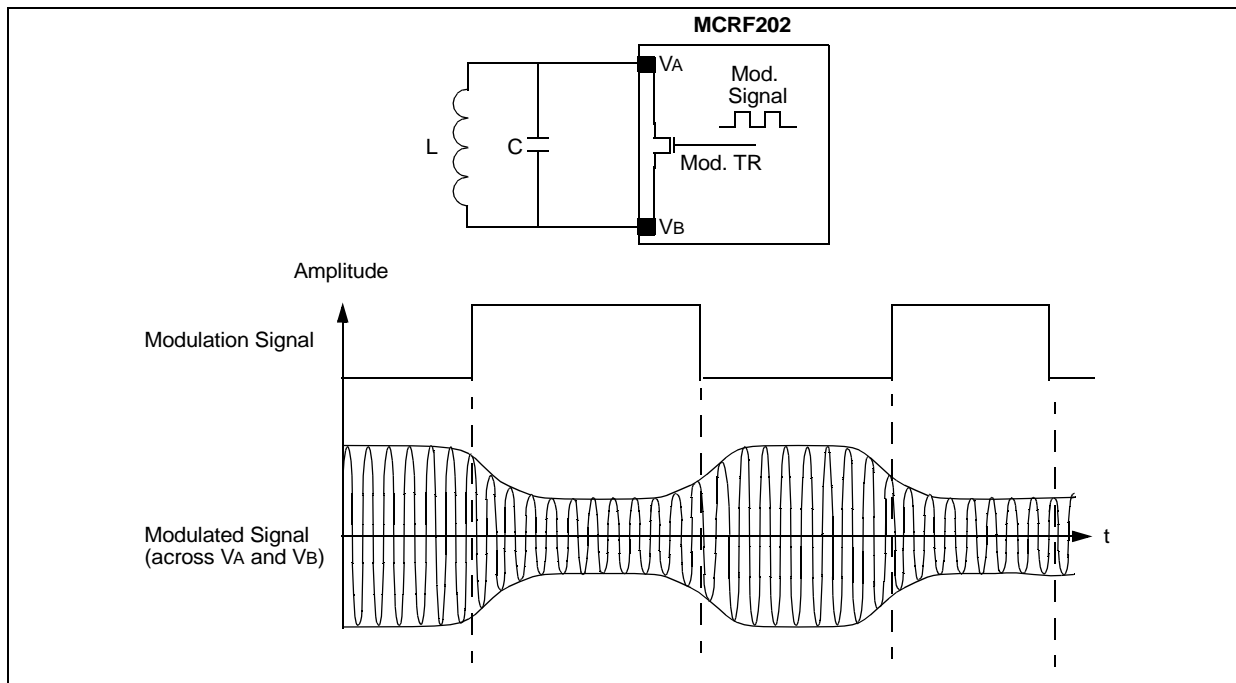

This circuit generates a Power-on Reset when the tag first enters the interrogator field. The Reset releases when sufficient power has developed on the VDD regulator to allow correct operation.

#### 2.1.6 SENSOR INPUT AND DATA INVERTER

The SENSOR input responds to logic high or logic low voltages to drive the internal inverter on or off. A logic high results in normal tag operation; a logic low at SENSOR input activates an inverter, which inverts the entire data stream prior to modulation.

The SENSOR input has an internal pull-down resistor of 800 k $\Omega$  (typical). See Figure 2-4 for application details.

FIGURE 2-1: MODULATION SIGNAL AND MODULATED SIGNAL

## 2.2 Configuration Register and Control Logic

The configuration register determines the operational parameters of the device. It directly controls logic blocks which generate the baud rate, memory size, encoded data, modulation protocol, etc. CB11 is always a zero. Once the array is successfully programmed at the factory, the lock bit CB12 is set. When the lock bit is set, programming and erasing the device becomes permanently disabled. Table 2-1 contains a description of the control register bit functions.

### 2.2.1 BAUD RATE TIMING OPTION

The chip will access data at a baud rate determined by bits CB2, CB3, and CB4 of the configuration register. For example, MOD32 (CB2 = 0, CB3 = 1, CB4 = 1) has 32 RF cycles per bit. This gives the data rate of 4 kHz for the RF carrier frequency of 128 kHz.

### 2.2.2 DATA ENCODING OPTION

This logic acts upon the serial data being read from the EEPROM. The logic encodes the data according to the configuration bits CB6 and CB7. CB6 and CB7 determine the data encoding method. The available choices are:

- Non-return to zero-level (NRZ\_L)
- Biphas\_S (Differential)
- Biphas\_L (Manchester)
- Inverted Manchester

### 2.2.3 MODULATION OPTION

CB8 and CB9 determine the modulation protocol of the encoded data. The available choices are:

- ASK
- FSK
- PSK\_1
- PSK\_2

When ASK (direct) option is chosen, the encoded data is fed into the modulation transistor without change.

When FSK option is chosen, the encoded data is represented by:

- a) Sets of 10 RF carrier cycles (first 5 cycles → higher amplitude, the last 5 cycles → lower amplitude) for logic "high" level.
- b) Sets of 8 RF carrier cycles (first 4 cycles → higher amplitude, the last 4 cycles → lower amplitude) for logic "low" level.

For example, FSK signal for MOD40 is represented:

- a) 4 sets of 10 RF carrier cycles for data '1'.
- b) 5 sets of 8 RF carrier cycles for data '0'.

Refer to Figure 2-2 for the FSK signal with MOD40 option.

The PSK\_1 represents change in the phase of the modulation signal at the change of the encoded data. For example, the phase changes when the encoded data is changed from '1' to '0', or from '0' to '1'.

The PSK\_2 represents change in the phase at the change on '1'. For example, the phase changes when the encoded data is changed from '0' to '1', or from '1' to '1'.

**FIGURE 2-2: ENCODED DATA AND FSK OUTPUT SIGNAL FOR MOD40 OPTION**

# MCRF202

**FIGURE 2-3: PSK DATA MODULATION**

## 2.2.4 MEMORY ARRAY LOCK BIT (CB12)

The CB12 bit must be a '1' for a factory programmed device.

## 2.3 Memory Section

The device has 128 bits of one-time programmable (OTP) memory. The user can choose 96 or 128 bits by selecting the CB1 bit in the configuration register. See Table 2-1 for more details.

### 2.3.1 COLUMN AND ROW DECODER LOGIC AND BIT COUNTER

The column and row decoders address the EEPROM array at the clock rate and generate a serial data stream for modulation. This data stream can be up to 128 bits in length. The size of the data stream is user programmable with CB1 and can be set to 96 or 128 bits. Data lengths of 48 and 64 bits are available by programming the data twice in the array, end-to-end.

The column and row decoders route the proper voltage to the array for programming and reading. In the programming modes, each individual bit is addressed serially from bit 1 to bit 128.

## 2.4 Examples of Configuration Settings

### EXAMPLE 2-1: "88D" CONFIGURATION

The "88D" (hex) configuration is interpreted as follows:

```

          CB12          CB1
          |             |
"88D" → 1000-1000-1101
    
```

Referring to Table 2-1, the "88D" configuration represents:

- Modulation = PSK\_1
- PSK rate =  $r/2$
- Data encoding = NRZ\_L (direct)
- Baud rate =  $r/32 = \text{MOD}32$
- Memory size: 128 bits
- Programmed device

### EXAMPLE 2-2: "80A" CONFIGURATION

The "80A" (hex) configuration is interpreted as follows:

```

          CB12          CB1
          |             |
"80A" → 1000-0000-1010
    
```

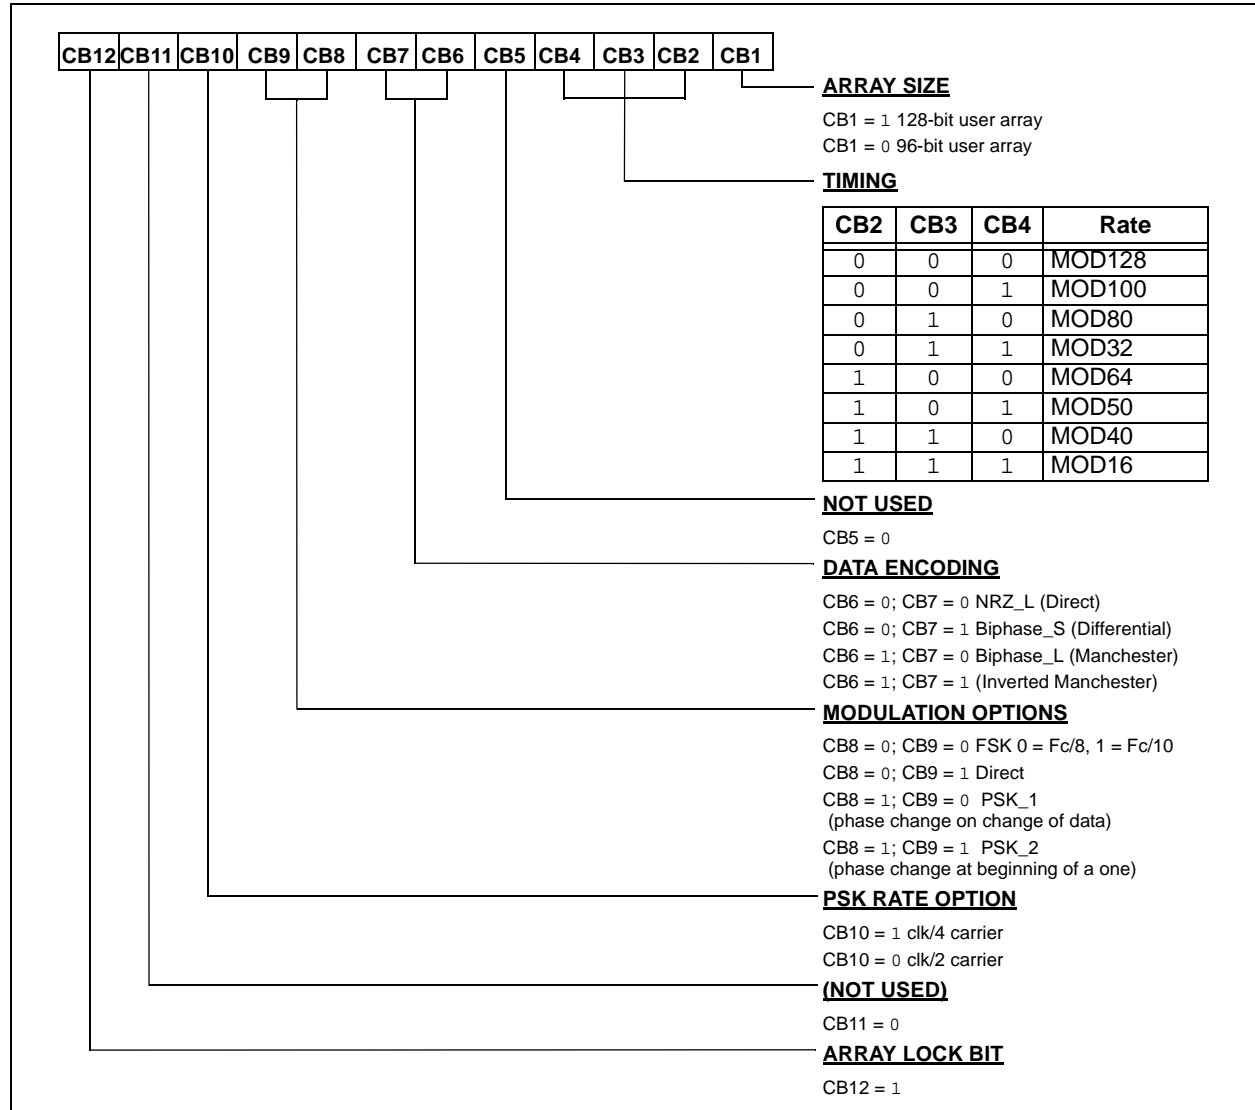

The MSB corresponds to CB12 and the LSB corresponds to CB1 of the configuration register. Therefore, we have:

- |        |        |        |       |
|--------|--------|--------|-------|
| CB12=1 | CB11=0 | CB10=0 | CB9=0 |
| CB8=0  | CB7=0  | CB6=0  | CB5=0 |
| CB4=1  | CB3=0  | CB2=1  | CB1=0 |

Referring to Table 2-1, the "80A" configuration represents:

- Programmed device, FSK protocol, NRZ\_L (direct) encoding, MOD50 (baud rate =  $r/50$ ), 96 bits.

**TABLE 2-1: CONFIGURATION REGISTER**

| Die backgrind thickness tolerance      | —<br>— | —<br>—               | ±1<br>±25.4 | mil<br>μm |  |
| Die passivation thickness (multilayer) | —      | 0.9050               | —           | μm        | <b>Note 4</b>  |
| Die Size:                              |        |                      |             |           |  |
| Die size X*Y before saw (step size)    | —      | 44.15 x 68.44        | —           | mil       | —  |
| Die size X*Y after saw                 | —      | 42.58 x 66.87        | —           | mil       | —  |

- Note 1:** The bond pad size is that of the passivation opening. The metal overlaps the bond pad passivation by at least 0.1 mil.
- 2:** Metal Pad Composition is 98.5% Aluminum with 1% Si and 0.5% Cu.
- 3:** As the die thickness decreases, susceptibility to cracking increases. It is recommended that the die be as thick as the application will allow.
- 4:** The Die Passivation thickness can vary by device depending on the mask set used:
- Layer 1: Oxide (undopped oxide 0.135 μm)
  - Layer 2: PSG (dopped oxide, 0.43 μm)
  - Layer 3: Oxynitride (top layer, 0.34 μm)
- 5:** The conversion rate is 25.4 μm/mil.

**Notice:** Extreme care is urged in the handling and assembly of die products since they are susceptible to mechanical and electrostatic damage.

**TABLE 3-4: WAFER MECHANICAL SPECIFICATIONS**

| Specifications            | Min | Typ    | Max | Unit  | Comments |
|---------------------------|-----|--------|-----|-------|----------|
| Wafer Diameter            | —   | 8      | —   | inch  | 150 mm   |
| Die separation line width | —   | 80     | —   | μm    |          |
| Dice per wafer            | —   | 14,000 | —   | die   |          |
| Batch size                | —   | 24     | —   | wafer |          |

## 4.0 FAILED DIE IDENTIFICATION

Every die on the wafer is electrically tested according to the data sheet specifications and visually inspected to detect any mechanical damage such as mechanical cracks and scratches.

Any failed die in the test or visual inspection is identified by black colored inking. Therefore, any die covered with black ink should not be used.

The ink dot specification:

- Ink dot size: minimum 20  $\mu\text{m}$  x 20  $\mu\text{m}$
- Position: central third of die
- Color: black

## 5.0 WAFER DELIVERY DOCUMENTATION

Each wafer container is marked with the following information:

- Microchip Technology Inc. MP Code
- Lot Number
- Total number of wafer in the container
- Total number of good dice in the container
- Average die per wafer (DPW)
- Scribe number of wafer with number of good dice.

## 6.0 NOTICE ON DIE AND WAFER HANDLING

The device is very susceptible to Electrostatic Discharge (ESD). ESD can cause critical damage to the device. Special attention is needed during the handling process.

Any ultraviolet (UV) light can erase the memory cell contents of an unpackaged device. Fluorescent lights and sun light can also erase the memory cell although it takes more time than UV lamps. Therefore, keep any unpackaged devices out of UV light and also avoid direct exposure from strong fluorescent lights and sun light.

Certain integrated circuit (IC) manufacturing, chip-on-board (COB) and tag assembly operations may use UV light. Operations such as backgrind, de-tape, certain cleaning operations, epoxy or glue cure should be done without exposing the die surface to UV light.

Using x-ray for die inspection will not harm the die, nor erase memory cell contents.

# MCRF202

---

## 7.0 PACKAGING INFORMATION

### 7.1 Package Marking Information

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

|                |        |  |
|----------------|--------|--|
| <b>Legend:</b> | XX...X | Customer specific information*             |
|                | YY     | Year code (last 2 digits of calendar year) |
|                | WW     | Week code (week of January 1 is week '01') |
|                | NNN    | Alphanumeric traceability code             |

|              |  |
|--------------|--|
| <b>Note:</b> | In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information. |
|--------------|--|

\* Standard OTP marking consists of Microchip part number, year code, week code, and traceability code.

\* Controlling Parameter

§ Significant Characteristic

Notes:

Dimensions D and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" (0.254mm) per side.

JEDEC Equivalent: MS-012

Drawing No. C04-057

## ON-LINE SUPPORT

Microchip provides on-line support on the Microchip World Wide Web site.

The web site is used by Microchip as a means to make files and information easily available to customers. To view the site, the user must have access to the Internet and a web browser, such as Netscape® or Microsoft® Internet Explorer. Files are also available for FTP download from our FTP site.

### Connecting to the Microchip Internet Web Site

The Microchip web site is available at the following URL:

**[www.microchip.com](http://www.microchip.com)**

The file transfer site is available by using an FTP service to connect to:

**<ftp://ftp.microchip.com>**

The web site and file transfer site provide a variety of services. Users may download files for the latest Development Tools, Data Sheets, Application Notes, User's Guides, Articles and Sample Programs. A variety of Microchip specific business information is also available, including listings of Microchip sales offices, distributors and factory representatives. Other data available for consideration is:

- Latest Microchip Press Releases
- Technical Support Section with Frequently Asked Questions
- Design Tips
- Device Errata
- Job Postings
- Microchip Consultant Program Member Listing
- Links to other useful web sites related to Microchip Products
- Conferences for products, Development Systems, technical information and more
- Listing of seminars and events

## SYSTEMS INFORMATION AND UPGRADE HOT LINE

The Systems Information and Upgrade Line provides system users a listing of the latest versions of all of Microchip's development systems software products. Plus, this line provides information on how customers can receive the most current upgrade kits. The Hot Line Numbers are:

1-800-755-2345 for U.S. and most of Canada, and

1-480-792-7302 for the rest of the world.

042003

## READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager  
RE: Reader Response

Questions:

1. What are the best features of this document?

---

---

2. How does this document meet your hardware and software development needs?

---

---

3. Do you find the organization of this document easy to follow? If not, why?

---

---

4. What additions to the document do you think would enhance the structure and subject?

---

---

5. What deletions from the document could be made without affecting the overall usefulness?

---

---

6. Is there any incorrect or misleading information (what and where)?

---

---

7. How would you improve this document?

---

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

| <u>PART NO.</u>    | <u>-X</u>  | <u>/XXX</u>                                       | <u>XXX</u>                                      |
|--------------------|--|---|---|
| Device             | Temperature Range  | Package   | Configuration                                   |
| Device:            | MCRF202 =  | 125 kHz MicroID tag with Sensor input, 96/128-bit |   |
| Temperature Range: | I  | =   | -40°C to +85°C                                  |
| Package:           | WF   | =   | Sawed wafer on frame (7 mil backgrind)          |
|                    | W  | =   | Wafer (11 mil backgrind)                        |
|                    | S  | =   | Dice in waffle pack (11 mil backgrind)          |
|                    | WFB  | =   | Sawed, Bumped wafer on frame (11 mil backgrind) |
|                    | WB   | =   | Bumped wafer (11 mil backgrind)                 |
|                    | SB   | =   | Bumped die in waffle pack (11 mil backgrind)    |
|                    | SN   | =   | Plastic SOIC (150 mil body) 8-lead              |
|                    | P  | =   | Plastic DIP (300 mil body) 8-lead               |
| Configuration:     | SQTP Customer Identifier. Assigned during the SQTP (factory programming) approval process. Usually QXX where XX is an integer used to track customer data files. |   |   |

### Examples:

- a) MCRF202-I/WQ99 = 125 kHz, industrial temperature, wafer package, factory programmed, sensor input, "Q99" sample customer code.

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.

NOTES:

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM  
CERTIFIED BY DNV  
== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, non-volatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
