[2]Single-ended measurement at crossing point. Value is maximum – minimum over all time. DC value of common mode is not important

[3]Minimum Frequency is a result of 0.5% down spread spectrum

[4]Differential measurement through the range of ±100 mV, differential signal must remain monotonic and within slew rate spec when crossing through this region.

[5] Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#.

[6] Max difference of t_{CYCLE} between any two adjacent cycles.

[7] Accumulated tjc.over a 10 µs time period, measured with JIT2 TIE at 50ps interval.

[8] VD(PK-PK) is the overall magnitude of the differential signal.

[9] VD(min) is the amplitude of the ring-back differential measurement, guaranteed by design, that ring-back will not cross 0V VD. VD(max) is the largest amplitude allowed.
