

# ACT5260

## 64-Bit Superscaler Microprocessor

### Features

- Full militarized QED RM5260 microprocessor
- Dual Issue superscaler QED RISCMark™ - can issue one integer and one floating-point instruction per cycle
- microprocessor - can issue one integer and one floating-point instruction per cycle
  - 100, 133 and 150MHz frequency (200MHz future option)  
Consult Factory for latest speeds
  - 260 Dhrystone2.1 MIPS
  - SPECint95 4.8. SPECfp95 5.1
- High performance system interface compatible with R4600, R4700 and R5000
  - 64-bit multiplexed system address/data bus for optimum price/performance up to 100 MHz operating frequency
  - High performance write protocols maximize uncached write bandwidth
  - Operates at input system clock multipliers of 2 through 8
  - 5V tolerant I/O's
  - IEEE 1149.1 JTAG boundary scan
- Integrated on-chip caches - up to 3.2GBps internal data rate
  - 16KB instruction - 2 way set associative
  - 16KB data - 2 way set associative
  - Virtually indexed, physically tagged
  - Write-back and write-through on per page basis
  - Pipeline restart on first double for data cache misses
- Integrated memory management unit
  - Fully associative joint TLB (shared by I and D translations)
  - 48 dual entries map 96 pages
  - Variable page size (4KB to 16MB in 4x increments)
- Embedded supply de-coupling capacitors and PII filter components
- High-performance floating point unit - up to 400 MFLOPS
  - Single cycle repeat rate for common single precision operations and some double precision operations
  - Two cycle repeat rate for double precision multiply and double precision combined multiply-add operations
  - Single cycle repeat rate for single precision combined multiply-add operation
- MIPS IV instruction set
  - Floating point multiply-add instruction increases performance in signal processing and graphics applications
  - Conditional moves to reduce branch frequency
  - Index address modes (register + register)
- Embedded application enhancements
  - Specialized DSP integer Multiply-Accumulate instruction and 3 operand multiply instruction
  - I and D cache locking by set
  - Optional dedicated exception vector for interrupts
- Fully static CMOS design with power down logic
  - Standby reduced power mode with WAIT instruction
  - 5 Watts typical at 3.3V, less than 175 mwatts in Standby
- 208-lead CQFP, cavity-up package (F17)
- 208-lead CQFP, inverted footprint (F24), Intended to duplicate the commercial QED footprint (*Consult Factory*)
- 179-pin PGA package (*Future Product*) (P10)

### BLOCK DIAGRAM

## DESCRIPTION:

The ACT5260 is a highly integrated superscalar microprocessor that implements a superset of the MIPS IV Instruction Set Architecture (ISA). It has a high performance 64-bit integer unit, a high throughput, fully pipelined 64-bit floating point unit, an operating system friendly memory management unit with a 48-entry fully associative TLB, a 16 KByte 2-way set associative instruction cache, a 16 KByte 2-way set associative data cache, and a high-performance 64-bit system interface. The ACT5260 can issue both an integer and a floating point instruction in the same cycle.

The ACT5260 is ideally suited for high-end embedded control applications such as internetworking, high performance image manipulation, high speed printing, and 3-D visualization.

## HARDWARE OVERVIEW

The ACT5260 offers a high-level of integration targeted at high-performance embedded applications. Some of the key elements of the ACT5260 are briefly described below.

### Superscalar Dispatch

The ACT5260 has an efficient asymmetric superscalar dispatch unit which allows it to issue an integer instruction and a floating-point computation instruction simultaneously. With respect to superscalar issue, integer instructions include alu, branch, load/store, and floating-point load/store, while floating-point computation instructions include floating-point add, subtract, combined multiply-add, converts, etc. In combination with its high throughput fully pipelined floating-point execution unit, the superscalar capability of the ACT5260 provides unparalleled price/performance in computationally intensive embedded applications.

### CPU Registers

Like all MIPS ISA processors, the ACT5260 CPU has a simple, clean user visible state consisting of 32 general purpose registers, two special purpose registers for integer multiplication and division, a program counter, and no condition code bits.

### Pipeline

For integer operations, loads, stores, and other non-floating-point operations, the ACT5260 uses the simple 5-stage pipeline also found in the circuits R4600, R4700, and R5000. In addition to this standard pipeline, the ACT5260 uses an extended seven stage pipeline for floating-point operations. Like the R5000, the ACT5260 does virtual to physical translation in parallel with cache access.

## Integer Unit

Like the R5000, the ACT5260 implements the MIPS IV Instruction Set Architecture, and is therefore fully upward compatible with applications that run on processors implementing the earlier generation MIPS I-III instruction sets. Additionally, the ACT5260 includes two implementation specific instructions not found in the baseline MIPS IV ISA but that are useful in the embedded market place. Described in detail in the QED RM5260 datasheet, these instructions are integer multiply-accumulate and 3-operand integer multiply.

The ACT5260 integer unit includes thirty-two general purpose 64-bit registers, a load/store architecture with single cycle ALU operations (add, sub, logical, shift) and an autonomous multiply/divide unit. Additional register resources include: the HI/LO result registers for the two-operand integer multiply/divide operations, and the program counter(PC).

## Register File

The ACT5260 has thirty-two general purpose registers with register location 0 hard wired to zero. These registers are used for scalar integer operations and address calculation. The register file has two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

## ALU

The ACT5260 ALU consists of the integer adder/subtractor, the logic unit, and the shifter. The adder performs address calculations in addition to arithmetic operations, the logic unit performs all logical and zero shift data moves, and the shifter performs shifts and store alignment operations. Each of these units is optimized to perform all operations in a single processor cycle

For additional Detail Information regarding the operation of the Quantum Effect Design (QED) RISCMark™ RM5260™, 64-Bit Superscalar Microprocessor see the latest QED datasheet (Revision 1.1 July 1998).

## Absolute Maximum Ratings<sup>1</sup>

Symbol	Rating	Range	Units
$V_{TERM}$	Terminal Voltage with respect to GND	-0.5 <sup>2</sup> to 4.6	V
$T_C$	Operating Temperature	-55 to +125	°C
$T_{BIAS}$	Case Temperature under Bias	-55 to +125	°C
$T_{STG}$	Storage Temperature	-55 to +125	°C
$I_{IN}$	DC Input Current	20 <sup>3</sup>	mA
$I_{OUT}$	DC Output Current	50	mA

Notes:

- Stresses above those listed under "AbsoluteMaximums Rating" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
- $V_{IN}$  minimum = -2.0V for pulse width less than 15nS.  $V_{IN}$  maximum should not exceed +5.5 Volts.
- When  $V_{IN} < 0V$  or  $V_{IN} > V_{CC}$ .
- No more than one output should be shorted at one time. Duration of the short should not exceed more than 30 second.

## Recommended Operating Conditions

Symbol	Parameter	Minimum	Maximum	Units
$V_{CC}$	Power Supply Voltage	+3.135	+3.465	V
$V_{IH}$	Input High Voltage	0.7 $V_{CC}$	$V_{CC} + 0.5$	V
$V_{IL}$	Input Low Voltage	-0.5	0.2 $V_{CC}$	V
$T_C$	Operating Temperature Case	-55	+125	°C
	For 133MHz Parts only	-40	+125	°C

## DC Characteristics

( $V_{CC} = 3.3V \pm 5\%$ ; 133MHz parts:  $T_c = -40^\circ C$  to  $+125^\circ C$ , All other parts  $T_c = -55^\circ C$  to  $+125^\circ C$ )

Parameter	Sym	Conditions	100 / 133 / 150MHz		Units
			Min	Max	
Output Low Voltage	$V_{OL1}$	$I_{OL} = 20 \mu A$	-	0.1	V
Output High Voltage	$V_{OH1}$	$I_{OL} = 20 \mu A$	$V_{CC} - 0.1$	-	V
Output Low Voltage	$V_{OL2}$	$I_{OL} = 4 mA$	-	0.4	V
Output High Voltage	$V_{OH2}$	$I_{OL} = 4 mA$	2.4	-	V
Input High Voltage	$V_{IH}$		0.7 $V_{CC}$	$V_{CC} + 0.5$	V
Input Low Voltage	$V_{IL}$		-0.5	0.2 $V_{CC}$	V
Input Current	$I_{IN1}$	$V_{IN} = 0V$	-20	+20	$\mu A$
Input Current	$I_{IN2}$	$V_{IN} = V_{CC}$	-20	+20	$\mu A$
Input Current	$I_{IN3}$	$V_{IN} = 5.5V$	-250	+250	$\mu A$
Input Capacitance	$C_{IN}$		-	10	pF
Output Capacitance	$C_{OUT}$		-	10	pF

## Power Consumption

Parameter	Symbol	Conditions	100MHz, 3.3V		133MHz, 3.3V		150MHz, 3.3V		Units
			Typ <sup>5</sup>	Max	Typ <sup>5</sup>	Max	Typ <sup>5</sup>	Max	
Active Operating Supply Current	I <sub>CC1</sub>	CL = 0pF, No SysAD activity	800	1550	800	1550	1000	1750	mA
	I <sub>CC2</sub>	CL = 50pF, R4000 write protocol without FPU operation	1000	1750	1000	1750	1150	1950	mA
	I <sub>CC3</sub>	CL = 50pF, write re-issue or pipelined writes	1100	2000	1100	2000	1250	2250	mA
Standby Current	I <sub>SB1</sub>	CL = 0pF	75	150	75	150	100	175	mA
	I <sub>SB1</sub>	CL = 50pF	75	150	75	150	100	175	mA

Notes:

5. Typical integer instruction mix and cache miss rates.

## AC Characteristics

(V<sub>CC</sub> = 3.3V ±5%; 133MHz parts: T<sub>c</sub> = -40°C to +125°C, All other parts T<sub>c</sub> = -55°C to +125°C)

## Capacitive Load Deration

Symbol	Parameter	100 / 133 / 150MHz		Units
		Minimum	Maximum	
CLD	Load Derate	-	2	ns/25pF

## Clock Parameters

Parameter	Symbol	Test Conditions	100/133/150MHz		Units
			Min	Max	
SysClock High	t <sub>SCHigh</sub>	Transition ≤ 5ns	4	-	ns
SysClock Low	t <sub>SCLow</sub>	Transition ≤ 5ns	4	-	ns
SysClock Frequency <sup>6</sup>			33	75	MHz
SysClock Period	t <sub>SCP</sub>		-	30	ns
Clock Jitter for SysClock	t <sub>JitterIn</sub>		-	±250	ps
SysClock Rise Time	t <sub>SCRise</sub>		-	5	ns
SysClock Fall Time	t <sub>SCFall</sub>		-	5	ns
ModeClock Period	t <sub>ModeCKP</sub>		-	256*t <sub>SCP</sub>	ns
JTAG Clock Period	t <sub>JTAGCKP</sub>		-	4*t <sub>SCP</sub>	ns

Notes:

6. Operation of the ACT5260 is only guaranteed with the Phase Loop enabled.

## System Interface Parameters<sup>7</sup>

Parameter	Symbol	Test Conditions	100MHz		133MHz		150MHz		Units
			Min	Max	Min	Max	Min	Max	
Data Output <sup>8</sup>	$t_{DO}$	mode <sub>14...13</sub> = 10 (fastest)	1.0	7.0	1.0	7.0	1.0	7.0	ns
		mode <sub>14...13</sub> = 11	1.0	7.5	1.0	7.5	1.0	7.5	ns
		mode <sub>14...13</sub> = 00	1.0	8.0	1.0	8.0	1.0	8.0	ns
		mode <sub>14...13</sub> = 01 (slowest)	1.0	8.5	1.0	8.5	1.0	8.5	ns
Data Setup	$t_{DS}$	$t_{RISE} = 5ns$	5.0	-	5.0	-	5.0	-	ns
Data Hold	$t_{DH}$	$t_{FALL} = 5ns$	2.0	-	2.0	-	2.0	-	ns

Notes: -

7. Timmings are are measured from from 1.5V of the clock to 1.5V of the signal.

8. Capacitive load for all output timing is 50pF.

## Boot Time Interface Parameters

Parameter	Symbol	Test Conditions	100/133/150MHz		Units
			Min	Max	
Mode Data Setup	$t_{DS}$		4	-	SysClock cycles
Mode Data Hold	$t_{DH}$		0	-	SysClock cycles
