◆ Outline

When the “S” pole of magnet faces the mark surface of the sensor and is closed to sensor ($B \geq B_{op}$), the sensor outputs low level; When magnet is far from sensor ($B \leq B_{rp}$), the sensor outputs high level. When the “N” pole faces the mark surface , the sensor is no response. Stable Hysteresis(($B_h = |B_{op} - B_{rp}|$) ensure the Stable sensor’s switch status. The magnet and electric transfer characteristic curve is shown as the figure:

◆ Block Diagram

Hall sensor AH3141 is one of unipolar excitation single-ended digital output Hall IC. The sensor chip has built-in reverse voltage protection, voltage regulators, temperature compensation circuit, Hall-voltage generator, signal amplifier, Schmitt trigger and open collector output drives circuit unit. Excellent voltage regulator and temperature compensation circuit ensure the sensor stable operates over a wide voltage range and temperature range, and the reverse voltage protection circuit avoids the sensor to be damaged by reverse voltage.
