

## 25W Power Packaged Transistor

### GaN HEMT on SiC

#### Description

The CHK025A-SOA is an unmatched packaged Gallium Nitride High Electron Mobility Transistor. It offers general purpose and broadband solutions for a variety of RF power applications. It is well suited for multi-purpose applications such as radar and telecommunication.

The CHK025A-SOA is developed on a 0.5 $\mu$ m gate length GaN HEMT process. It requires an external matching circuitry.

The CHK025A-SOA is available as a ceramic-metal flange power package providing low parasitic and low thermal resistance.

#### Main Features

- Wide band capability: up to 5GHz
- Pulsed and CW operating modes
- High power: > 25W
- High Efficiency: up to 70%
- DC bias:  $V_{DS} = 50V$  @  $I_{D,Q} = 200mA$
- MTTF >  $10^6$  hours @  $T_j = 200^\circ C$
- RoHS Flange Ceramic package

$V_{DS} = 50V$ ,  $I_{D,Q} = 200mA$ , Freq=4GHz

<sup>(1)</sup> Input RF and gate voltage are pulsed. Conditions are 25µs width, 10% duty cycle and 1µs offset between RF and DC pulse.

These values are the intrinsic performance of the packaged device. They are deduced from measurements and simulations. They are considered in the reference plane defined by the leads of the package, at the connection interface with the PCB.

The typical performance achievable in more than 20% frequency band around 4GHz was demonstrated using the reference board 61500252 presented hereafter.

## Recommended Assembly Procedure

CHK025A-SOA is available has a flange package to be bolt down onto a thermal heat sink also used as main electrical ground. Use preferably screw M2 and flat washers.

Thermal and electrical resistance at the package to heat sink interface has to be as low as possible. Thermal electrically conductive grease or conductive thin layer like indium sheets are recommended between the package and the heat sink.

In case a thermal grease is selected, we recommend to use material offering thermal conductivity  $>5\text{W/m.K}$  and electrical resistivity  $<0.01\text{ ohm.cm}$ . The grease layer thickness should be about  $25\mu\text{m}$  (1 mil).

Contact interface quality can be improved by cleaning process prior device mounting on the heat-sink. Such operation will enhance the thermal and electrical contact by oxides removal at each interface.

Package leads can be soldered on printed circuit board's traces by using RoHS solder past. Cavity depth and width to be performed into the heat-sink where the device will be mounted are important to achieve the best performances. These dimensions have to be optimized in order to minimize the distance between device and signal traces made on the printed circuit board (PCB). But they also have to be calculated in order to accommodate device variations in height. The following drawing gives the relationship between device dimensions ( $H_{\text{pack}}$  &  $W_{\text{pack}}$ ) and optimal cavity depth ( $H_{\text{cav}}$ ) and width ( $W_{\text{cav}}$ ) depending on the printed circuit-board configuration (HPCB)

$$H_{\text{cav}} = (H_{\text{pack}_{\text{min}}} - H_{\text{PCB}_{\text{max}}})^{+0}_{-0.05}$$

$$W_{\text{cav}} = (W_{\text{pack}_{\text{max}}} + 0.4) \pm 0.05$$

dimensions are in mm

## Recommended environmental management

UMS products are compliant with the regulation in particular with the directives RoHS N°2011/65 and REACH N°1907/2006. More environmental data are available in the application note AN0019 also available at <http://www.ums-gaas.com>.

## Recommended ESD management

Refer to the application note AN0020 available at <http://www.ums-gaas.com> for ESD sensitivity and handling recommendations for the UMS package products.
