

# HT16514

# **Dot Character VFD Controller & Driver**

#### **Features**

- Logic voltage: 2.7V~5.5V
- High voltage: 60V (max.)
- Provides a driving segment for cursor display (48 units)
- Alphanumeric and symbolic display through built-in ROM
- 80×8-bit display RAM
- On chip ROM (5×8 dot), in total 248 characters, plus 8 user-defined characters
- · Customized ROM acceptable

- · Display contents:
  - 16 columns by 2 (1) rows + 32 (16) cursors
  - 20 columns by 2 (1) rows + 40 (20) cursors
  - 24 columns by 2 (1) rows + 48 (24) cursors
- Supports display output (80-segment & 24-grid)
- Parallel data input/output (switchable 4 bit or 8 bit) or serial data input/output
- · Built-in oscillation circuit
- 144-pin LQFP package

## **Applications**

- · Consumer products panel function control
- Industrial measuring instrument panel function control
- · Other similar application panel function control

## **General Description**

The HT16514 is a Vacuum Fluorescent Display, VFD controller/driver with dot matrix VFD display. It consists of 80 segment output lines and 24 grid output lines. It can display up to 16C×2L, 20C×2L, 24C×2L.

The HT16514 has a character generator ROM which stores up to  $248 \times 5 \times 8$  dot characters.

The HT16514 has serial/parallel interface. This VFD controller/driver is ideal as an MCU peripheral device.

# **Ordering Information**

Part Number	Package Information					
HT16514-001	144-pin plastic LQFP (Fine pitch) (20×20), standard ROM (ROM code: 001)					
HT16514-002	144-pin plastic LQFP (Fine pitch) (20×20), standard ROM (ROM code: 002)					

Rev. 1.00 1 October 4, 2006

## **Block Diagram**

# **Pin Assignment**

# **Pin Description**

I/O	Description
(Micı	roprocessor Interface)
I	When parallel mode is selected, this pin is utilized to select the register, either Instruction Register or Data Register.  0: IR (Instruction Register)  1: DR (Data Register)  When serial mode is selected, this pin performs strobe input. Data can be set as input when this signal goes 0.  During the next rising edge of this signal, command processing is performed.
I	When M68 parallel mode is selected (E), this pin is write enable. Writes data at the falling edge. When i80 parallel mode is selected (RD), this pin is read enable. When this pin is "Low", data is output to the data Bus.  When Serial mode is selected, this pin is shift clock input, data will be written at the rising edge.
ı	When this pin is "Low", the device is active.
I О	Connected to an external resistor to generate an oscillation frequency.
0	Oscillator signal output pin
I	When M68 parallel mode is selected (R, W), this pin is data mode select pin (0: write, 1: read). When i80 parallel mode is selected $(\overline{WR})$ , this pin is a write enable pin. Data will be written at rising edge signal. When serial mode is selected, connect this pin to "Hi" or "Low". Read or Write is chosen by instruction.
I/O	When serial mode is selected, this pin is used as I/O pin. When parallel mode is selected, this pin needs to be connected to "Hi" or "Low".
I/O	When parallel mode is selected, these pins are used as I/O pins.  Data are stored sequentially, the first bit which is sent to the HT16514 is MSB.  If 4 bits mode is selected, only DB4~DB7 are used.
I	Initialize all the internal register and commands. All segments and digits are fixed PGND.
I	Set the duty ratio. Duty ratio will determine the number of grid.  The relationship between duty ratio and these pins is shown in Table 1-1.
ı	Select interface mode (parallel mode or serial mode) 0: Serial mode 1: Parallel mode In parallel mode, instruction will determine the length of word.
I	Select interface mode (i80 type CPU mode or M68 type CPU mode) 0: i80 type CPU mode 1: M68 type CPU mode
I	Select number of display line when power ON reset or resetting.  0: Select 1 line (N=0), "N" is display line select flag in Function set command.  1: Select 2 line (N=1)
ı	Set segment outputs pin assignment. The selection table is listed as Table 1-2 & Table 1-7
I	0 or open: Normal operation mode 1: Test mode
0	For IC testing only, leave this pin open.
(To	External Extension Driver)
0	Serial data output for extension digit driver.
0	Shift clock pulse for extension digit driver. Active during rising edge

Pin Name	I/O	Description
CL	0	Clear signal for extension digit driver, active low.  The digit data stored in the latch register of the extension driver are output when this signal is "Hi", if this signal is "Low", extension driver outputs are "Low".
LE	0	Latch enable signal for extension digit driver.
Output Pins		
G1~G24	0	High-voltage output, grid output pins.
S1~S80	0	High-voltage output, segment output pins.
Power System	1	
VDD	_	Pins for logic circuit
LGND	_	LGND is ground pin for logic circuit
VH	_	Power supply pins for VFD driver circuit
PGND	_	PGND is ground pin for VFD driver circuit

# Table 1-1. Duty Ratio Setting

DS0	DS1	Duty Ratio
0	0	1/16 (# of grid = 16)
0	1	1/24 (# of grid = 24)
1	0	1/20 (# of grid = 20)
1	1	1/40 (# of grid = 40)*

Note: \* When setting to 1/40 duty mode, use the external extension grid driver.

# HT16514 Connect to VFD as Below Figure

## **Approximate Internal Connections**

# **Absolute Maximum Ratings**

Logic Supply VoltageV <sub>SS</sub> –0.3V to V <sub>SS</sub> +6.0V	Driver Supply VoltageV <sub>SS</sub> -0.3V to V <sub>SS</sub> +80V
Input VoltageV <sub>SS</sub> –0.3V to $V_{DD}$ +0.3V	Output VoltageV <sub>SS</sub> -0.3V to V <sub>DD</sub> +0.3V
Driver Output VoltageV <sub>SS</sub> -0.3V to V <sub>H</sub>	Driver Output Current±50mA
Driver Output Current (Total)500 (Est.) mA	Storage Temperature55°C to 125°C
Operating Temperature40°C to 85°C	

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

# **D.C. Characteristics**

# Parallel Mode (M68 Input)

# Parallel Mode (M68 Output)

Note: The input signal rising time and falling time ( $t_f$ ,  $t_r$ ) is specified at 15ns or less.

All timing is specified using 20% and 80% of  $V_{\text{DD}}$  as the reference.

 $PW_{\mbox{\footnotesize EH}}$  is specified as the overlap between  $\overline{\mbox{\footnotesize CS}}$  being L and E.

## **Power Supply Connection Sequence**

- Connect the PGND and LGND externally to have an equal potential voltage
- To avoid faulty connection, turn on the driver power supply (V<sub>H</sub>) after turning on the logic power supply (V<sub>DD</sub>). Then turn off the logic power supply (V<sub>DD</sub>) after turning off the driver power supply (V<sub>H</sub>).
- If the power connection sequence recommended by Holtek is not followed, there's a possibility that the internal logic transistors may be damaged.

#### **Functional Description**

#### **CPU Interface**

HT16514 have 4 or 8-bit parallel interface or serial interface. These modes are selected by IM pin.

IM="0": Serial modeIM="1": Parallel mode

	CPU Interface Table								
IM	CS	RS, ST	E (RD), SCK	R, W (WR)	MPU	SI, SO	DB0~DB7		
0	CS	ST	SCK	Note	Note	SI, SO	Note		
1	<del>CS</del>	RS	E (RD)	R, W (WR)	MPU	Note	DB0~DB7		

Note: Keep this pin Hi or Lo.

#### Registers (IR, DR)

The HT16514 has two 8-bit registers, namely, an instruction register (IR) and a data register (DR). The IR register stores instruction code such as display clear and cursor shift. It also contains address information for display data RAM (DDRAM) and character generator RAM (CGRAM). The IR can only be written from the MPU. The DR temporarily stores data to be written into or read from the DDRAM or CGRAM. Data written into the DR from the MPU is automatically written into the DDRAM or CGRAM by internal operation. The DR is also used for data storage when reading data from the DDRAM or CGRAM. When the address information is written into the IR, data is read and then stored into the DR from the DDRAM or CGRAM by internal operation. Data transfer between the MPU is completed when the MPU reads the DR. After the read, data in DDRAM or CGRAM at the next address is sent to the DR for the next read from the MPU. These two registers can be selected by the register selector (RS) signal, (Refer to CPU Interface table).

				Registers (IR, DR) Table
Common	M68	i80		Dominton Colontian
RS	R, W	RD	WR	Register Selection
0	0	1	0	Write IR data during internal operation (display clear, etc.)
0	1	0	1	Read data to be busy flag (DB7) and address counter (DB6~DB0)
1	0	1	0	Write DR data (DR→DDRAM, CGRAM)
1	1	0	1	Read DR data (DDRAM, CGRAM→DR)

## Busy Flag (Read BF Flag)

Busy flag data (DB7) is always output as "0".

#### Address Counter (AC)

The Address counter (AC) assigns address to both DDRAM and CGRAM. When an instruction address is written into the IR, the address information is sent from the IR to the AC.

Selection of either DDRAM or CGRAM is also determined concurrently by the instruction. After writing into (or read from) the DDRAM or CGRAM, the AC is automatically incremented by 1 (or decremented by 1). The cursor position are then output to DB0~DB6 when RS=0 and R, W=1 (Refer to Registers (IR, DR) Table).

Rev. 1.00 October 4, 2006

## Display Data RAM (DDRAM)

The Display data RAM (DDRAM) stores display data represented in 8-bit character codes. Its extended capacity is  $80\times8$  bits or 80 characters. The area in the DDRAM that is not used for display can be used as general data RAM. Refer to DDRAM address table for the relationships between DDRAM address and positions on the VFD.

The DDRAM address (ADD) is set in the address counter (AC) as hexadecimal.

	DDRAM Address Table												
High Order Bits Low Order Bits													
AC6	AC5	AC4	AC3	AC2	AC1	AC0							
Hexadecimal Hexadecimal													

Example: DDRAM address "3FH"

0	1	1	1	1	1	1
	3			ı	=	

• 1-line display (N=0)

**Display Position** 

(Digit)	1	2	3	4	5	6	79	80
DDRAM Address	00	01	02	03	04	05	4E	4F

(Hexadecimal)

When there are fewer than 80 display characters, the display begins at the head position. For example, if using only one HT16514, 24 characters are displayed. When display shift operation is performed, the DDRAMaddress shifts as shown in the following table.

Example: 1-line by 24-character Display Table

Display Position

(Digit)	1	2	3	4	5	6	23	24
DDRAM Address	00	01	02	03	04	05	16	17
(Hexadecimal)								
For Shift Left	01	02	03	04	05	06	17	18
For Shift Right	4F	00	01	02	03	04	15	16

Rev. 1.00 21 October 4, 2006

## • 2-line display (N=1)

**Display Position** 

(Digit)	1	2	3	4	5	6	39	40
DDRAM Address	00	01	02	03	04	05	26	27
(Hexadecimal)	40	41	42	43	44	45	66	67

When the number of display character is less than 40×2 lines, the 2 lines are displayed from the head. The first line end address and the second line start address are not consecutive.

For example, if using only one HT16514, 24 characters  $\times$  2 lines are displayed. When display shift operation is performed, the DDRAM address shifts as shown in the following table.

Example: 2-line by 24-character Display Table

Display Position

(Digit)	1	2	3	4	5	6	23	24
DDRAM Address	00	01	02	03	04	05	16	17
(Hexadecimal)	40	41	42	43	44	45	56	57
	01	02	03	04	05	06	17	18
For Shift Left	41	42	43	44	45	46	57	58
	27	00	01	02	03	04	15	16
For Shift Right	67	40	41	42	43	44	55	56

#### • 40 Characters×2 line display

The DDRAM stores the character code of each character being displayed on the VFD. Valid DDRAMaddresses are 00H to 27H and 40H to 67H. The DDRAMnot used for display characters can be used as general purpose RAM. The tables below show the relationship between the DDRAMaddress and the character position on the VFD display shift as shown in the following table.

Example: 2-line by 40-character Display Table

Display Position

(Digit)	1	2	3	4		23	24	25		39	40
DDRAM Address	00	01	02	03		16	17	18		26	27
(Hexadecimal)	40	41	42	43		56	57	58		66	67
	00	01	02	03		17	18	19		27	00
For Shift Left	41	42	43	44		57	58	59		57	40
·											
	27	00	01	02		15	16	17		25	26
For Shift Right	67	40	41	42		55	56	57		65	66
			ŀ	HT1651	14 Display			E	Extension Driver	Display	/

- Character Generator ROM (CGROM)
  - CGROM for generating character patterns of 5×8 dots from 8-bit character codes, generates 248 type of character patterns.
  - The character codes are shown on the following page.
  - Character codes 00H to 0FH are allocated to the CGRAM

Character Code Table 1 (ROM Code: 001)

Character Code Table 2 (ROM Code: 002)

#### **Character Generator RAM (CGRAM)**

The CGRAM stores the pixel information (1=pixel on, 0=pixel off) for the eight user-define 5×8 characters. Valid CGRAM addresses are 00H to 3FH. CGRAM not used to defined characters can be used as general purpose RAM. Character codes 00H~07H (or 08H~0FH) are assigned to the user-defined characters (see section 5.0 character font tables). The table below shows the relationship between the character codes, CGRAM addresses, and CGRAM data for each user-defined character.

Relationship between CGRAM address and character code (DDRAM) and 5×7 (with cursor) dot character patterns (CGRAM)

Cha	ırac	ter	Со	de (	RA	M E	Data)	С	GR	AM A	Addr	ess	i			CG	RA	M D	ata

0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	X X X X X X X	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 1 1 1	0 0 1 1 0 0 1 1	0 1 0 1 0 1 0	X X X X X X	X X X X X X X	X X X X X X X	1 1 1 1 1 1	0 0 0 1 0 0 0	0 0 0 1 0 0 0	0 0 0 1 0 0 0	1 1 1 1 1 1 1 0	Character Pattern (1)
0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	X X X X X X	0 0 0 0 0 0	0 0 0 0 0 0	1 1 1 1 1 1	0 0 0 0 0 0	0 0 0 0 0 0	1 1 1 1 1 1 1	0 0 0 0 1 1 1	0 0 1 1 0 0 1 1	0 1 0 1 0 1 0	X X X X X X	X X X X X X X	X X X X X X X	1 0 0 0 0 0 0	1 0 0 0 0 0 0	1 1 1 1 1 1 0	1 0 0 0 0 0 0	0 0 0 0 0 0	Character Pattern (2)
			4	,					$\forall$			₩					,	<b>V</b>				
0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	0 0 0 0 0 0	X X X X X X	1 1 1 1 1 1 1	1 1 1 1 1 1 1	1 1 1 1 1 1 1	1 1 1 1 1 1 1 1	1 1 1 1 1 1 1	1 1 1 1 1 1 1	0 0 0 0 1 1 1	0 0 1 1 0 0 1 1	0 1 0 1 0 1	X X X X X X	X X X X X X	X X X X X X	1 1 1 1 1 1 1	0 0 0 1 0 0	0 0 1 0 1 0 0 1	0100010	1000000	Character Pattern (8)

Note: "X" means don't care

Character code bits 0~2 correspond to CGRAM address bits 3~5 (3 bits: 8 types)

CGRAM address bits 0~2 designate character pattern line position. The 8th line is the cursor position and its display is formed by a logical OR with the cursor. Maintain the 8th line data, corresponding to the cursor display position at 0 as the cursor display. If the 8th line data is 1, 1 bit will light up the 8th line regardless of the cursor presence.

Character pattern row position corresponds to CGRAM data bits 0~4 (bit 4 being at the left).

CGRAM character patterns are selected when character code bits  $4\sim7$  are all 0. However, since character code bit 3 has no effect, the N display example above can be selected by either character code 00H or 08H.

1 for CGRAM data corresponds to display selection and 0 to no selection.

#### **Timing Generation Circuit**

Timing generation circuit generates timing signals for the operation of internal circuit such as DDRAM, CGRAM and CGROM. The RAM reads the timing for display and the internal operation timing by MPU access are generated separately to avoid interfering with each other. Therefore, when writing data to DDRAM, for example, there will be no undesirable interference, such as flickering, in areas other than the display area.

Rev. 1.00 25 October 4, 2006

#### **VFD Driver Circuit**

VFD driver circuit consists of 24 grid signal drivers and 80 segment signal drivers. When the character font and number of digits are selected by hardware (DS0, DS1) at power on, the required grid signal drivers automatically output drive waveforms, while the other grid signal driver continue to output non-selection waveforms.

Sending serial data is latched when the display data character pattern corresponds to the last address of the display data RAM (DDRAM).

Since serial data is latched when the display data character pattern corresponds to the starting address enters the internal shift register, the HT16514 drives from the head display.

#### **Cursor/Blink Control Circuit**

Cursor/blink control circuit generates the cursor or character blinking. The cursor or the blinking will appear with the digit located at the display data RAM (DDRAM) address set in the address counter (AC).

For example, when the address counter is 08H, the cursor position is displayed at DDRAM address 08H.

1-line Display

2-line Display

Note: The cursor or blinking appears when the address counter (AC) selects the character generator RAM (CGRAM). However, the cursor and blinking become meaningless when the cursor or blinking is displayed in the meaningless position when AC is a CGRAM address.

## Interface With CPU Mode

• Parallel Data Transfer M68 (IM=1, MPU=1)

This IC can interface (data transfer) with the CPU in 4 or 8 bits in M68 interface.

However, the internal registers consist of 8 bits. Using the DB4 to DB7 twice must perform data transfer in 4 bits. When using 4-bit parallel data transfer, DB0 to DB3 pins remain Hi or Low. The transfer order is initially from the higher 4 bits (D4 to D7) then followed by the lower 4 bits (D0 to D3).

BF checks are performed before transferring the higher 4 bits. BF checks are not required before transferring the lower 4 bits.

Rev. 1.00 26 October 4, 2006

# • 8-bit data transfer (M68)

#### Parallel mode for i80 (IM=1, MPU=0)

When setting "IM=1, MPU=0", i80 is selected. In the HT16514, each time data is sent from the MPU, a type of pipeline process between LSIs is performed through the bus holder attached to internal data bus.

There is a certain restriction in the read sequence of this display data RAM. Please be advised that data of the specified address is not generated by the read instruction issued immediately after the address setup. This data is generated in data read for the second time. Thus, a dummy read is required whenever the address setup or write cycle operation is selected. This relationship is shown in the following figure.

#### Writing MPU

#### Reading MPU

#### **Serial Mode**

In the synchronous serial interface mode, instructions and data are sent between the host and the module using 8-bit bytes. Two bytes are required per read/write cycle and are transmitted MSB first. The start byte contains 5 high bits, the Read/Write (R/W) control bit, the Register Select (RS) control bit, and a low bit. The subsequent byte contains the instruction/data bits. The R/W bit determines whether the cycle is a read (high) or a write (low) cycle. The RS bit is used to identify the second byte as an instruction (low) or data (high).

This mode uses the strobe  $(\overline{ST})$  control signal, Serial Clock (SCK) input, and Serial I/O (SI/SO) line to transfer information. In a write cycle, bits are clocked into the module on the rising edge of SCK. In a read cycle, bits in the start byte are clocked into the module on the rising edge of SCK. After a minimum wait time, each bit in the instruction/data byte can be read from the module after each falling edge of SCK. Each read/write cycle begins on the falling edge of  $\overline{ST}$  and ends on the rising edge. To be a valid read/write cycle, the  $\overline{ST}$  must go high at the end of the cycle.

## Commands

Instruction	RS	R, W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	Description
Clear display	0	0	0	0	0	0	0	0	0	0	Clear all display, and sets the DDRAM ad- dress at 00H.
Cursor home	0	0	0	0	0	0	0	0	1	x	Sets the DDRAM address at 00H. Also returns the display shifted to the original position. The DDRAM contents remain unchanged.
Entry mode set	0	0	0	0	0	0	0	1	I/D	S	Sets the cursor direction and specifies the display shift. These operations are performed during writing/reading data.
Display On/Off	0	0	0	0	0 0 1 D C					В	Sets all display ON/OFF(D), cursor ON/OFF(C), cursor blink of character position (B).
Cursor or display shift	0	0	0	0	0 1 S/C R/L x x					х	Shifts display or cursor, while keeping the DDRAM contents.
Function	0	0	0	0	1 DL N x BR1 BR0					BR0	Sets data length (in parallel data transfer) and Number of line
CGRAM address set	0	0	0	1			AC	CG			Sets the address of the CGRAM. After that, data of the DDRAM is transferred.
DDRAM address set	0	0	1		ADD						Sets the address of the DDRAM. After that, data of the DDRAM is transferred.
Read busy flag & address	0	1	BF=0		ACC						Reads the busy flag (BF) and the address counter. BF is output as "0" always.
Write data to CGRAM or DDRAM	1	0			Write data						Writes data into the CGRAM of the DDRAM.
Read data from CGRAM or DDRAM	1	1			Read DR data						Reads data from the CGRAM or DDRAM.

Note: I/D=1: Increment, I/D=0: Decrement

S=1: Display shift enable, S=0: Cursor shift enable

S/C=1: Display shift, S/C=0: Cursor shift R/L=1: Right shift, R/L=0: Left shift

DL=1: 8bit, DL=0: 4bit

BR1, BR0= (00: 100%), (01: 75%), (10: 50%), (11: 25%)

"X": Don't care
ACG: CGRAM address
ADD: DDRAM address
ACC: Address counter
DDRAM: Display Data RAM
CGRAM: Character Generator RAM

#### **Clear Display**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0	_
Code	0	0	0	0	0	0	0	0	0	1	1

#### The instruction:

- Fills all locations in the display data RAM (DDRAM) with 20H (Blank character).
- Clears the contents of the address counter (ACC) to 00H.
- Sets display for zero character shifts (returns to original position).
- Sets the address counter to point to the display data RAM (DDRAM).
- If cursor is displayed, move cursor to the left most character in the top line (upper line).
- Sets address counter (ACC) to increment on each access to DDRAM or CGRAM.

#### When resetting

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	0	0	0	1

#### **Cursor Home**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	0	0	х

#### The instruction:

- Clears the contents of the address counter (ACC) to 00H.
- Sets the address counter to point to the display data RAM (DDRAM).
- Sets display for zero character shifts (returns to original position).
- If cursor is displayed, move cursor to the left most character in the top line (upper line).

#### **Entry Mode**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	0	1	I/D	S

This instruction selects whether the cursor position increments or decrements after each DDRAM or CGRAM access and determines the direction the information on the display shifts after each DDRAM write. The instruction also enables or disables display shifts after each DDRAM write (information on the display does not shift after a DDRAM read or CGRAM access). The DDRAM, CGRAM, and cursor position are not affected by this instruction.

I/D=0: The AC decrements after each DDRAM or CGRAM access.

If S=1, the information on the display shifts to the right by one character position after each DDRAM write.

I/D=1: The AC increments after each DDRAM or CGRAM access.

If S=1, the information on the display shifts to the left by one character position after each DDRAM write.

S=0: The display shift function is disabled.

S=1: The display shift function is enabled.

	Cursor Move and Display Shift by the Entry Mode Set										
I/D	S	After Writing DDRAM Data	After Reading DDRAM Data								
0	0	Cursor moves one character to the left.	Cursor moves one character to the right.								
1	0	Cursor moves one character to the right.	Cursor moves one character to the right.								
0	1	Display shifts one character to the right without cursor movements.	Cursor moves one character to the left.								
1	1	Display shifts one character to the left without cursor movements.	Cursor moves one character to the right.								

# When resetting

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	0	0	1	D	С	В

This instruction selects whether the display and cursor are on or off and selects whether or not the character at the current cursor position blinks. The DDRAM, CGRAM, and cursor position are not affected by this instruction.

- D=0: The display is off (display blank).
- D=1: The display is on (contents of the DDRAM is displayed).
- C=0: The cursor is off.
- C=1: The cursor is on (8th rows of pixels).
- B=0: The blinking character function is disabled.
- B=1: The blinking character function is enabled

Note: A character with all pixels on will alternate with the character displayed at the current cursor position at a 1Hz rate with a 50% duty cycle.

#### When resetting

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	0	0	1	0	0	0

#### **Cursor or Display Shift**

This instruction shifts the display and/or moves the cursor to the left or right, without reading or writing to the DDRAM.

"S/C" bit selects movement of the cursor or movement of both cursor and display.

- S/C=1: Shift both cursor and display.
- S/C=0: Shift only the cursor.

"R/L" bit selects whether moving the direction to the left or right of the display and/or cursor.

- R/L=1: Shift one character right.
- R/L=0: Shift one character left.

	Cursor or Display Shift									
S/C	R/L	Cursor Position	Information on the Display							
0	0	Decrements by one (left)	No change							
0	1	Increments by one (right)	No change							
1	0	Decrements by one (left)	Shifts on character position to the left							
1	1	Increments by one (right)	Shifts on character position to the right							

## **Function Set**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	0	1	DL	N	Х	BR1	BR0

This instruction sets the width of the data bus for the parallel interface modes, the number of display lines, and the luminance level (brightness) of the VFD. DDRAM, CGRAM, and cursor position are not affected by this instruction.

- DL=0: Sets the data bus width for the parallel interface modes to 4-bit (DB7~DB4).
- DL=1: Sets the data bus width for the parallel interface modes to 8-bit (DB7~DB0).
- N=0: Sets the number of display lines to 1 (this setting is not recommended).
- N=1: Sets the number of display lines to 2

BR1, BR0 flag is brightness control for the VFD to modulate the pulse width of the segment output as follows.

 $t_{DSP}{\cong}200\mu s,\,t_{BLK}{\cong}10\mu s$ 

BR1	BR0	Brightness	t <sub>P</sub>
0	0	100%	t <sub>DSP</sub> ×1.00
0	1	75%	t <sub>DSP</sub> ×0.75
1	0	50%	t <sub>DSP</sub> ×0.50
1	1	25%	t <sub>DSP</sub> ×0.25

Note: "n" means number of grid, T=nx ( $t_{DSP}+t_{BLK}$ )

## When resetting

DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
0	0	1	1	1	0	0	0

#### **CGRAM Address Set**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	0	1	А	А	А	Α	Α	А

This instruction places the 6-bit CGRAM address specified by DB5~DB0 into the cursor position. Subsequent data writes (reads) will be to (from) the CGRAM. The DDRAM and CGRAM contents are not affected by this instruction.

When resetting: Don't care.

#### **DDRAM Address Set**

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	0	1	Α	А	А	Α	Α	Α	Α

This instruction places the 7-bit DDRAM address specified by DB6~DB0 into the cursor position. Subsequent data writes (reads) will be to (from) the DDRAM. The DDRAM and CGRAM contents are not affected by this instruction.

Valid DDRAM Address Ranges								
Number of Character Address Range								
1st line	40	00H~27H						
2nd line	2nd line 40 40H~67H							

When resetting: Don't care.

#### Read Busy Flag and Address

	RS	R,W	DB7	DB6	DB5	DB4	DB3	DB2	DB1	DB0
Code	0	1	BF	Α	Α	А	Α	Α	Α	Α

This instruction reads the Busy Flag (BF)\* and the value of address counter in binary "AAAAAAA". This address counter is used by the CGRAM and DDRAM addresses, its value is determined by the previous instruction. The address counter contents are the same as for instructions "CGRAM address set" and "DDRAM address set".

Note: "\*" means the Busy Flag (BF) always outputs a "0".

#### Write Data to the CGRAM or DDRAM

This instruction writes the 8-bit data byte on DB7~DB0 into the DDRAM or CGRAM location addressed by the cursor position. The most recent DDRAM or CGRAM Address Set instruction determines whether the write is to the DDRAM or CGRAM. This instruction also increments or decrements the cursor position and shifts the display according to the I/D and S bits set by the Entry Mode Set instruction.

## Read Data from CGRAM or DDRAM

This instruction reads the 8-bit data byte from the DDRAM or CGRAM location addressed by the cursor position on DB7~DB0. The most recent DDRAM or CGRAM Address Set instruction determines whether the read is from the DDRAM or CGRAM. This instruction also increments or decrements the cursor position and shifts the display according to the I/D and S bits set by the Entry Mode Set instruction. Before sending this instruction, a DDRAM or CGRAM Address Set instruction should be executed to set the cursor position to the desired DDRAM or CGRAM address to be read.

After reading one data, the value of the address is automatically increased or decreased by 1 according to the selection by "Entry mode".

Note: The Address counter is automatically increased or decreased by 1 after a data write instruction to the CGRAM or DDRAM are executed. But at this moment the data to be pointed to by the address counter cannot be read if a data read instruction is executed. Therefore, to read data correctly, executing an address set instruction or cursor shift instruction (the only case of a DDRAM data read) just before reading, or reading the second data in case of reading data continuously by executing a read data instruction.

Rev. 1.00 34 October 4, 2006

#### **Power ON Reset**

After a power-on reset, the module is initialize to the following conditions:

- All DDRAM locations are set to 20H (character code for a space).
- The cursor position is set to DDRAMaddress 00H
- The relationship between DDRAM addresses and character positions on the VFD is set to the non-shifted position.
- Entry Mode Set instruction bits:

I/D=1: The cursor position increments after each DDRAM or CGRAM access.

If S=1, the information on the display shifts to the left by one character position after each DDRAM write.

S=0: The display shift function is disabled.

• Display On/Off Control instruction bits:

D=0: The display is off (display blank).

C=0: The cursor is off.

B=0: The blinking character function is disabled.

• Function Set instruction bits:

DL=1: Sets the data bus width for the parallel interface modes to 8 bits (DB7~DB0).

N=1: Number of display lines is set to 2.

BR1, BR0=0,0: Sets the luminance level to 100%.

• MPU interface, duty ratio selection are based on the following table.

Relationship between Status of HT16514 and Pin Selection at Power on Reset								
Pin Name				Function	Remark			
TEST	IM	DS1	DS0	runction	Keillaik			
1	Х	х	х	Self test mode	This is effective on aging.			
0 or open	0	х	х	Serial interface	SI, SO, SCK, ST			
0 or open	1	х	х	Parallel interface	RS, E, R, W, DB7~DB4 or DB7~DB0			
0 or open	Х	0	0	Duty= 1/16 (16C×1 or 2L display)				
0 or open	Х	0	1	Duty= 1/20 (20C×1 or 2L display)	It's not necessary to use the extension driver. The number of line is selected by instruction.			
0 or open	х	1	0	Duty= 1/24 (24C×1 or 2L display)	The manual of this is solded by moradic			
0 or open	х	1	1	Duty= 1/40 (40C×1 or 2L display)	Extension driver should be used. The number of line is selected by instruction.
