MAXWELL TECHNOLOGIES™

28LV010
3.3V 1 Megabit (128K x 8-Bit)
EEPROM

Logic Diagram

FEATURES:

- 3.3V low voltage operation 128K x 8 Bit EEPROM
- RAD-PAK® radiation-hardened against natural space radiation
- Total dose hardness:
  - > 100 krad (Si), depending upon space mission
- Excellent Single Event Effects:
  - $SEL_{TH} > 84$ MeV/mg/cm^2
  - $SEU_{TH} > 37$ Mev/mg/cm^2 (read mode)
  - SEU saturated cross section = 3E-6 cm^2 (read mode)
  - $SEU_{TH} = 11.4$ Mev/mg/cm^2 (write mode)
  - SEU saturated cross section = 5E-3 cm^2 (write mode) with hard errors
- Package:
  - 32 Pin RAD-PAK® flat pack
  - 32 Pin RAD-PAK® DIP
  - JEDEC-approved byte-wide pinout
- Address Access Time:
  - 200, 250 ns maximum access times available
- High endurance:
  - 10,000 erase/write (in Page Mode), 10-year data retention
- Page write mode:
  - 1 to 128 bytes
- Automatic programming
  - 10 ms automatic page/byte write
- Low power dissipation
  - 20 mW/MHz active current (typ.)
  - 72 µW standby (maximum)

DESCRIPTION:

Maxwell Technologies′ 28LV010 high density, 3.3V, 1 Megabit EEPROM microcircuit features a greater than 100 krad (Si) total dose tolerance, depending upon space mission. The 28LV010 is capable of in-system electrical Byte and Page programmability. It has a 128-Byte Page Programming function to make its erase and write operations faster. It also features Data Polling and a Ready/Busy signal to indicate the completion of erase and programming operations. In the 28LV010, hardware data protection is provided with the RES pin, in addition to noise protection on the WE signal and write inhibit on power on and off. Meanwhile, software data protection is implemented using the JEDEC-optional Standard algorithm. The 28LV010 is designed for high reliability in the most demanding space applications.

Maxwell Technologies' patented RAD-PAK® packaging technology incorporates radiation shielding in the microcircuit package. It eliminates the need for box shielding while providing the required radiation shielding for a lifetime in orbit or space mission. In a GEO orbit, RAD-PAK provides greater than 100 krad (Si) radiation dose tolerance. This product is available with screening up to Class S.

EEPROM APPLICATION NOTES

This application note describes the programming procedures for the EEPROM modules and with details of various techniques to preserve data protection.

Automatic Page Write

Page-mode write feature allows 1 to 128 bytes of data to be written into the EEPROM in a single write cycle, and allows the undefined data within 128 bytes to be written corresponding to the undefined address (A0 to A6). Loading the first byte of data, the data load window opens 30 µs for the second byte. In the same manner each additional byte of data can be loaded within 30 µs. In case $\overline{CE}$ and $\overline{WE}$ are kept high for 100(s after data input, EEPROM enters erase and write mode automatically and only the input data are written into the EEPROM.

$\overline{WE}$ $\overline{CE}$ Pin Operation

During a write cycle, addresses are latched by the falling edge of $\overline{WE}$ or $\overline{CE}$, and data is latched by the rising edge of $\overline{WE}$ or $\overline{CE}$.

Data Polling

Data Polling function allows the status of the EEPROM to be determined. If EEPROM is set to read mode during a write cycle, an inversion of the last byte of data to be loaded outputs from I/O 7 to indicate that the EEPROM is performing a write operation.

RDY/$\overline{Busy}$ Signal

RDY/$\overline{Busy}$ signal also allows a comparison operation to determine the status of the EEPROM. The RDY/$\overline{Busy}$ signal has high impedance except in write cycle and is lowered to V_{OL} after the first write signal. At the-end of a write cycle, the RDY/$\overline{Busy}$ signal changes state to high impedance.

$\overline{\text{RES}}$ Signal

When $\overline{\text{RES}}$ is LOW, the EEPROM cannot be read and programmed. Therefore, data can be protected by keeping $\overline{\text{RES}}$ low when V_{CC} is switched. $\overline{\text{RES}}$ should be high during read and programming because it doesn't provide a latch function.

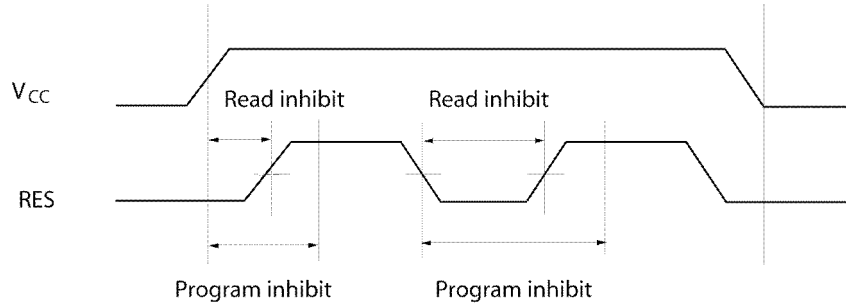

Data Protection

To protect the data during operation and power on/off, the EEPROM has the internal functions described below.

1. Data Protection against Noise of Control Pins ($\overline{\text{CE}}$, $\overline{\text{OE}}$, $\overline{\text{WE}}$) during Operation.

   During readout or standby, noise on the control pins may act as a trigger and turn the EEPROM to programming mode by mistake. To prevent this phenomenon, the EEPROM has a noise cancellation function that cuts noise if its width is 20 ns or less in programming mode. Be careful not to allow noise of a width of more than 20 ns on the control pins.

2. Data Protection at V_{CC} on/off

When V_{CC} is turned on or off, noise on the control pins generated by external circuits, such as CPUs, may turn the EEPROM to programming mode by mistake. To prevent this unintentional programming, the EEPROM must be kept in unprogrammable state during V_{CC} on/off by using a CPU reset signal to $\overline{RES}$ pin.
$\overline{RES}$ should be kept at V_{SS} level when V_{CC} is turned on or off. The EEPROM breaks off programming operation when $\overline{RES}$ become low, programming operation doesn't finish correctly in case that $\overline{RES}$ falls low during programming operation. $\overline{RES}$ should be kept high for 10 ms after the last data input.
3. Software Data Protection

The software data protection function is to prevent unintentional programming caused by noise generated by external circuits. In software data protection mode, 3 bytes of data must be input before write data as follows. These bytes can switch the non-protection mode to the protection mode.

Software data protection mode can be canceled by inputting the following 6 bytes. Then, the EEPROM turns to the non-protection mode and can write data normally. However, when the data is input in the canceling cycle, the data cannot be written.
