

3V 2M × 8 / 1M × 16 - CMOS Flash EEPROM

Features

- Organization: 2M×8 / 1M×16
- Sector architecture
 - One 16K; two 8K; one 32K; and thirty-one 64K byte sectors
 - One 8K; two 4K; one 16K; and thirty-one 32K word sectors
 - Boot code sector architecture—T (top) or B (bottom)
 - Erase any combination of sectors or full chip
- Single 2.7-3.6V power supply for read/write operations
- Sector protection
- High speed 70/80/90/120 ns address access time
- Automated on-chip programming algorithm
 - Automatically programs/verifies data at specified address
- Automated on-chip erase algorithm
 - Automatically preprograms/erases chip or specified sectors
- Hardware **RESET** pin
 - Resets internal state machine to read mode
- Low power consumption
 - 200 nA typical automatic sleep mode current
 - 200 nA typical standby current
 - 10 mA typical read current
- JEDEC standard software, packages and pinouts
 - 48-pin TSOP
 - 44-pin SO (availability TBD)
- CFI (Common Flash Interface) compliant
- Detection of program/erase cycle completion
 - DQ7 DATA polling
 - DQ6 toggle bit
 - RY/BY output
- Erase suspend/resume
 - Supports reading data from or programming data to a sector not being erased
- Low V_{CC} write lock-out below 1.5V
- 10 year data retention at 150C
- 100,000 write/erase cycle endurance

Pin arrangement

Selection guide

		29LV160-70	29LV160-80	29LV160-90	29LV160-120	Unit
Maximum access time	t _{AA}	70	80	90	120	ns
Maximum chip enable access time	t _{CE}	70	80	90	120	ns
Maximum output enable access time	t _{OE}	30	30	35	50	ns

Functional description

The AS29LV160 is a 16 megabit, 3.0 volt Flash memory organized as 2 Megabyte of 8 bits/1 Megabyte of 16 bits each. For flexible erase and program capability, the 8 megabits of data is divided into thirty-five sectors: one 16K, two 8K, one 32K, and thirty-one 64k byte sectors; or one 8K, two 4K, one 16K, and thirty-one 32K word sectors. The $\times 8$ data appears on DQ0–DQ7; the $\times 16$ data appears on DQ0–DQ15. The AS29LV160 is offered in JEDEC standard 48-pin TSOP, 48-pin BGA, and 44-pin SO (availability TBD) packages. This device is designed to be programmed and erased in-system with a single 3.0V V_{CC} supply. The device can also be reprogrammed in standard EPROM programmers.

The AS29LV160 offers access times of 70/80/90/120 ns, allowing 0-wait state operation of high speed microprocessors. To eliminate bus contention the device has separate chip enable (\overline{CE}), write enable (\overline{WE}), and output enable (\overline{OE}) controls. Word mode ($\times 16$ output) is selected by $\overline{BYTE} = \text{high}$. Byte mode ($\times 8$ output) is selected by $\overline{BYTE} = \text{low}$.

The AS29LV160 is fully compatible with the JEDEC single power supply Flash standard. Write commands are sent to the command register using standard microprocessor write timings. An internal state-machine uses register contents to control the erase and programming circuitry. Write cycles also internally latch addresses and data needed for the programming and erase operations. Read data from the device occurs in the same manner as other Flash or EPROM devices. Use the program command sequence to invoke the automated on-chip programming algorithm that automatically times the program pulse widths and verifies proper cell margin. Use the erase command sequence to invoke the automated on-chip erase algorithm that preprograms the sector (if it is not already programmed before executing the erase operation), times the erase pulse widths, and verifies proper cell margin.

Boot sector architecture enables the system to boot from either the top (AS29LV160T) or the bottom (AS29LV160B) sector. Sector erase architecture allows specified sectors of memory to be erased and reprogrammed without altering data in other sectors. A sector typically erases and verifies within 1.0 seconds. Hardware sector protection disables both program and erase operations in all, or any combination of, the nineteen sectors. The device provides true background erase with Erase Suspend, which puts erase operations on hold to either read data from, or program data to, a sector that is not being erased. The chip erase command will automatically erase all unprotected sectors.

A factory shipped AS29LV160 is fully erased (all bits = 1). The programming operation sets bits to 0. Data is programmed into the array one byte at a time in any sequence and across sector boundaries. A sector must be erased to change bits from 0 to 1. Erase returns all bytes in a sector to the erased state (all bits = 1). Each sector is erased individually with no effect on other sectors.

The device features single 3.0V power supply operation for Read, Write, and Erase functions. Internally generated and regulated voltages are provided for the Program and Erase operations. A low V_{CC} detector automatically inhibits write operations during power transitions. The $\overline{RY}/\overline{BY}$ pin, \overline{DATA} polling of DQ7, or toggle bit (DQ6) may be used to detect end of program or erase operations. The device automatically resets to the read mode after program/erase operations are completed. DQ2 indicates which sectors are being erased.

The AS29LV160 resists accidental erasure or spurious programming signals resulting from power transitions. Control register architecture permits alteration of memory contents only after successful completion of specific command sequences. During power up, the device is set to read mode with all program/erase commands disabled when V_{CC} is less than V_{LKO} (lockout voltage). The command registers are not affected by noise pulses of less than 5 ns on \overline{OE} , \overline{CE} , or \overline{WE} . To initiate write commands, \overline{CE} and \overline{WE} must be logical zero and \overline{OE} a logical 1.

When the device's hardware \overline{RESET} pin is driven low, any program/erase operation in progress is terminated and the internal state machine is reset to read mode. If the \overline{RESET} pin is tied to the system reset circuitry and a system reset occurs during an automated on-chip program/erase algorithm, data in address locations being operated on may become corrupted and requires rewriting. Resetting the device enables the system's microprocessor to read boot-up firmware from the Flash memory.

The AS29LV160 uses Fowler-Nordheim tunnelling to electrically erase all bits within a sector simultaneously. Bytes are programmed one at a time using EPROM programming mechanism of hot electron injection.

Operating modes

Mode	\overline{CE}	\overline{OE}	\overline{WE}	A0	A1	A6	A9	RESET	DQ
ID read MFR code	L	L	H	L	L	L	V _{ID}	H	Code
ID read device code	L	L	H	H	L	L	V _{ID}	H	Code
Read	L	L	H	A0	A1	A6	A9	H	D _{OUT}
Standby	H	X	X	X	X	X	X	H	High Z
Output disable	L	H	H	X	X	X	X	H	High Z
Write	L	H	L	A0	A1	A6	A9	H	D _{IN}
Enable sector protect	L	V _{ID}	Pulse/L	L	H	L	V _{ID}	H	X
Sector unprotect	L	V _{ID}	Pulse/L	L	H	H	V _{ID}	H	X
Temporary sector unprotect	X	X	X	X	X	X	X	V _{ID}	X
Verify sector protect [†]	L	L	H	L	H	L	V _{ID}	H	Code
Verify sector unprotect [†]	L	L	H	L	H	H	V _{ID}	H	Code
Hardware Reset	X	X	X	X	X	X	X	L	High Z

L = Low (<V_{IL}) = logic 0; H = High (>V_{IH}) = logic 1; V_{ID} = 10.0 ± 1.0V; X = don't care.

In ×16 mode, BYTE = V_{IH}. In ×8 mode, BYTE = V_{IL} with DQ8-DQ14 in high Z and DQ15 = A-1.

[†]Verification of sector protect/unprotect during A9 = V_{ID}

Mode definitions

Item	Description
ID MFR code, device code	Selected by A9 = V _{ID} (9.5V–10.5V), $\overline{CE} = \overline{OE} = A1 = A6 = L$, enabling outputs. When A0 is low (V _{IL}) the output data = 52h, a unique Mfr. code for Alliance Semiconductor Flash products. When A0 is high (V _{IH}), D _{OUT} represents the device code for the AS29LV160.
Read mode	Selected with $\overline{CE} = \overline{OE} = L$, $\overline{WE} = H$. Data is valid in t _{ACC} time after addresses are stable, t _{CE} after \overline{CE} is low and t _{OE} after \overline{OE} is low.
Standby	Selected with $\overline{CE} = H$. Part is powered down, and I _{CC} reduced to <1.0 μA when $\overline{CE} = V_{CC} \pm 0.3V = \text{RESET}$. If activated during an automated on-chip algorithm, the device completes the operation before entering standby.
Output disable	Part remains powered up; but outputs tri-stated with \overline{OE} pulled high.
Write	Selected with $\overline{CE} = \overline{WE} = L$, $\overline{OE} = H$. Accomplish all Flash erasure and programming through the command register. Contents of command register serve as inputs to the internal state machine. Address latching occurs on the falling edge of \overline{WE} or \overline{CE} , whichever occurs later. Data latching occurs on the rising edge \overline{WE} or \overline{CE} , whichever occurs first. Filters on \overline{WE} prevent spurious noise events from appearing as write commands.
Enable sector protect	Hardware protection circuitry implemented with external programming equipment causes the device to disable program and erase operations for specified sectors. For in-system sector protection, refer to Sector protect algorithm on page 15.
Sector unprotect	Disables sector protection for all sectors using external programming equipment. All sectors must be protected prior to sector unprotection. For in-system sector unprotection, refer to Sector unprotect algorithm on page 15.

Item	Description
Verify sector protect/unprotect	Verifies write protection for sector. Sectors are protected from program/erase operations on commercial programming equipment. Determine if sector protection exists in a system by writing the ID read command sequence and reading location XXX02h, where address bits A12–18 select the defined sector addresses. A logical 1 on DQ0 indicates a protected sector; a logical 0 indicates an unprotected sector.
Temporary sector unprotect	Temporarily disables sector protection for in-system data changes to protected sectors. Apply +10V to RESET to activate temporary sector unprotect mode. During temporary sector unprotect mode, program protected sectors by selecting the appropriate sector address. All protected sectors revert to protected state on removal of +10V from RESET .
RESET	Resets the internal state machine to read mode. If device is programming or erasing when RESET = L, data may be corrupted.
Deep power down	Hold RESET low to enter deep power down mode (<1 μ A). Recovery time to start of first read cycle is 50ns.
Automatic sleep mode	Enabled automatically when addresses remain stable for 300ns. Typical current draw is 1 μ A with no current drawn by the external devices from the output pin. Existing data is available to the system during this mode. If an address is changed, automatic sleep mode is disabled and new data is returned within standard access times.

² See footnote "2" on preceding page. Fourth bus cycle in the autoselect mode is a read cycle with the data in the "READ codes table" on the preceding page expected.

Command definitions

Item	Description
Reset/Read	<p>Initiate read or reset operations by writing the Read/Reset command sequence into the command register. This allows the microprocessor to retrieve data from the memory. Device remains in read mode until command register contents are altered.</p> <p>Device automatically powers up in read/reset state. This feature allows only reads, therefore ensuring no spurious memory content alterations during power up.</p>
ID Read	<p>AS29LV160 provides manufacturer and device codes in two ways. External PROM programmers typically access the device codes by driving +10V on A9. AS29LV160 also contains an ID Read command to read the device code with only +3V, since multiplexing +10V on address lines is generally undesirable.</p> <p>Initiate device ID read by writing the ID Read command sequence into the command register. Follow with a read sequence from address XXX00h to return MFR code. Follow ID Read command sequence with a read sequence from address XXX01h to return device code.</p> <p>To verify write protect status on sectors, read address XXX02h. Sector addresses A19–A12 produce a 1 on DQ0 for protected sector and a 0 for unprotected sector.</p> <p>Exit from ID read mode with Read/Reset command sequence.</p>
Hardware Reset	<p>Holding RESET low for 500 ns resets the device, terminating any operation in progress; data handled in the operation is corrupted. The internal state machine resets 20 μs after RESET is driven low. RY/BY remains low until internal state machine resets. After RESET is set high, there is a delay of 50 ns for the device to permit read operations.</p>
Byte/word Programming	<p>Programming the AS29LV160 is a four bus cycle operation performed on a byte-by-byte or word-by-word basis. Two unlock write cycles precede the Program Setup command and program data write cycle. Upon execution of the program command, no additional CPU controls or timings are necessary. Addresses are latched on the falling edge of CE or WE, whichever is last; data is latched on the rising edge of CE or WE, whichever is first. The AS29LV160's automated on-chip program algorithm provides adequate internally-generated programming pulses and verifies the programmed cell margin.</p> <p>Check programming status by sampling data on the RY/BY pin, or either the DATA polling (DQ7) or toggle bit (DQ6) at the program address location. The programming operation is complete if DQ7 returns equivalent data, if DQ6 = no toggle, or if RY/BY pin = high.</p> <p>The AS29LV160 ignores commands written during programming. A hardware reset occurring during programming may corrupt the data at the programmed location.</p> <p>AS29LV160 allows programming in any sequence, across any sector boundary. Changing data from 0 to 1 requires an erase operation. Attempting to program data 0 to 1 results in either DQ5 = 1 (exceeded programming time limits); reading this data after a read/reset operation returns a 0. When programming time limit is exceeded, DQ5 reads high, and DQ6 continues to toggle. In this state, a Reset command returns the device to read mode.</p>

Command definitions

Item	Description
Unlock Bypass Command Sequence	<p>The unlock bypass feature increases the speed at which the system programs bytes or words to the device because it bypasses the first two unlock cycles of the standard program command sequence.</p> <p>To initiate the unlock bypass command sequence, two unlock cycles must be written, then followed by a third cycle which has the unlock bypass command, 20h.</p> <p>The device then begins the unlock bypass mode. In order to program in this mode, a two cycle unlock bypass program sequence is required. The first cycle has the unlock bypass program command, A0h. It is followed by a second cycle which has the program address and data. To program additional data, the same sequence must be followed.</p> <p>The unlock bypass mode has two valid commands, the Unlock Bypass Program command and the Unlock Bypass Reset command. The only way the system can exit the unlock bypass mode is by issuing the unlock bypass reset command sequence. This sequence involves two cycles. The first cycle contains the data, 90h. The second cycle contains the data 00h. Addresses are don't care for both cycles. The device then returns to reading array data.</p>
Chip Erase	<p>Chip erase requires six bus cycles: two unlock write cycles; a setup command, two additional unlock write cycles; and finally the Chip Erase command.</p> <p>Chip erase does not require logical 0s to be written prior to erasure. When the automated on-chip erase algorithm is invoked with the Chip Erase command sequence, AS29LV160 automatically programs and verifies the entire memory array for an all-zero pattern prior to erase. The 29LV160 returns to read mode upon completion of chip erase unless DQ5 is set high as a result of exceeding time limit.</p>
Sector Erase	<p>Sector erase requires six bus cycles: two unlock write cycles, a setup command, two additional unlock write cycles, and finally the Sector Erase command. Identify the sector to be erased by addressing any location in the sector. The address is latched on the falling edge of \overline{WE}; the command, 30h is latched on the rising edge of \overline{WE}. The sector erase operation begins after a sector erase time-out.</p> <p>To erase multiple sectors, write the Sector Erase command to each of the addresses of sectors to erase after following the six bus cycle operation above. Timing between writes of additional sectors must be less than the erase time-out period, or the AS29LV160 ignores the command and erasure begins. During the time-out period any falling edge of \overline{WE} resets the time-out. Any command (other than Sector Erase or Erase Suspend) during time-out period resets the AS29LV160 to read mode, and the device ignores the sector erase command string. Erase such ignored sectors by restarting the Sector Erase command on the ignored sectors.</p> <p>The entire array need not be written with 0s prior to erasure. AS29LV160 writes 0s to the entire sector prior to electrical erase; writing of 0s affects only selected sectors, leaving non-selected sectors unaffected. AS29LV160 requires no CPU control or timing signals during sector erase operations.</p> <p>Automatic sector erase begins after sector erase time-out from the last rising edge of \overline{WE} from the sector erase command stream and ends when the \overline{DATA} polling (DQ7) is logical 1. \overline{DATA} polling address must be performed on addresses that fall within the sectors being erased. AS29LV160 returns to read mode after sector erase unless DQ5 is set high by exceeding the time limit.</p>
Common Flash Interface	<p>In order to achieve long term system compatibility, certain information about the internal configuration of the memory is provided which can be accessed in this mode. According to this information, system software may be configured for both upward and downward compatibility with Flash in a similar family. CFI mode can be entered by issuing CFI command either from read or from autoselect mode. The system can read CFI information at the addresses given in the tables below.</p>

Command definitions

Item	Description
Erase Suspend	<p>Erase Suspend allows interruption of sector erase operations to read data from or program data to a sector not being erased. Erase suspend applies only during sector erase operations, including the time-out period. Writing an Erase Suspend command during sector erase time-out results in immediate termination of the time-out period and suspension of erase operation.</p> <p>AS29LV160 ignores any commands during erase suspend other than Read/Reset, Program or Erase Resume commands. Writing the Erase Resume Command continues erase operations. Addresses are Don't Care when writing Erase Suspend or Erase Resume commands.</p> <p>AS29LV160 takes 0.2–15 μs to suspend erase operations after receiving Erase Suspend command. To determine completion of erase suspend, either check DQ6 after selecting an address of a sector not being erased, or poll RY/$\overline{\text{BY}}$. Check DQ2 in conjunction with DQ6 to determine if a sector is being erased. AS29LV160 ignores redundant writes of Erase Suspend.</p> <p>While in erase-suspend mode, AS29LV160 allows reading data (erase-suspend-read mode) from or programming data (erase-suspend-program mode) to any sector not undergoing sector erase; these operations are treated as standard read or standard programming mode. AS29LV160 defaults to erase-suspend-read mode while an erase operation has been suspended.</p> <p>Write the Resume command 30h to continue operation of sector erase. AS29LV160 ignores redundant writes of the Resume command. AS29LV160 permits multiple suspend/resume operations during sector erase.</p>
Sector Protect	<p>When attempting to write to a protected sector, $\overline{\text{DATA}}$ polling and Toggle Bit 1 (DQ6) are activated for about $<1 \mu$s. When attempting to erase a protected sector, $\overline{\text{DATA}}$ polling and Toggle Bit 1 (DQ6) are activated for about $<5 \mu$s. In both cases, the device returns to read mode without altering the specified sectors.</p>

CFI description and tables:

Common Flash Memory Interface Query Identification String

Addresses (Word Mode)	Addresses (Byte Mode)	Data	Description
10h	20h	0051h	Query unique ASCII string (QRY)

46h	8Ch	0002h	Erase suspend, 0 = not supported, 1 = to read only, 2 = to read and write
47h	8Eh	0001h	Sector protect, 0 = not supported, X = number of sectors in per group
48h	90h	0001h	Sector temporary unprotect, 00 = not supported, 01 = supported
49h	92h	0004h	Sector protect/unprotect scheme
4Ah	94h	0000h	Simultaneous operation, 00 = not supported, 01 = supported
4Bh	96h	0000h	Burst mode type, 00 = not supported, 01 = supported
4Ch	98h	0000h	Page mode type, 00 = not supported, 01 = 4 word page, 02 = 8 word page

Status operations

DATA polling (DQ7)	Only active during automated on-chip algorithms or sector erase time outs. DQ7 reflects complement of data last written when read during the automated on-chip program algorithm (0 during erase algorithm); reflects true data when read after completion of an automated on-chip program algorithm (1 after completion of erase algorithm).
Toggle bit 1 (DQ6)	Active during automated on-chip algorithms or sector erase time outs. DQ6 toggles when \overline{CE} or \overline{OE} toggles, or an Erase Resume command is invoked. DQ6 is valid after the rising edge of the fourth pulse of \overline{WE} during programming; after the rising edge of the sixth \overline{WE} pulse during chip erase; after the last rising edge of the sector erase \overline{WE} pulse for sector erase. For protected sectors, DQ6 toggles for $<1 \mu\text{s}$ during program mode writes, and $<5 \mu\text{s}$ during erase (if all selected sectors are protected).
Exceeding time limit (DQ5)	Indicates unsuccessful completion of program/erase operation (DQ5 = 1). DATA polling remains active. If DQ5 = 1 during chip erase, all or some sectors are defective; during byte programming or sector erase, the sector is defective (in this case, reset the device and execute a program or erase command sequence to continue working with functional sectors). Attempting to program 0 to 1 will set DQ5 = 1.
Sector erase timer (DQ3)	Checks whether sector erase timer window is open. If DQ3 = 1, erase is in progress; no commands will be accepted. If DQ3 = 0, the device will accept sector erase commands. Check DQ3 before and after each Sector Erase command to verify that the command was accepted.
Toggle bit 2 (DQ2)	During sector erase, DQ2 toggles with \overline{OE} or \overline{CE} only during an attempt to read a sector being erased. During chip erase, DQ2 toggles with \overline{OE} or \overline{CE} for all addresses. If DQ5 = 1, DQ2 toggles only at sector addresses where failure occurred, and will not toggle at other sector addresses. Use DQ2 in conjunction with DQ6 to determine whether device is in auto erase or erase suspend mode.
Ready/Busy	$\overline{RY}/\overline{BY}$ indicates whether an automated on-chip algorithm is in progress ($\overline{RY}/\overline{BY}$ = low) or completed ($\overline{RY}/\overline{BY}$ = high). The device does not accept Program/Erase commands when $\overline{RY}/\overline{BY}$ = low. $\overline{RY}/\overline{BY}$ = high when device is in erase suspend mode. $\overline{RY}/\overline{BY}$ = high when device exceeds time limit, indicating that a program or erase operation has failed. $\overline{RY}/\overline{BY}$ is an open drain output, enabling multiple $\overline{RY}/\overline{BY}$ pins to be tied in parallel with a pull up resistor to V_{CC} .

Write operation status

	Status	DQ7	DQ6	DQ5	DQ3	DQ2	$\overline{RY}/\overline{BY}$
Standard mode	Auto programming	$\overline{DQ7}$	Toggle	0	N/A	No toggle	0
	Program/erase in auto erase	0	Toggle	0	1	Toggle [†]	0
Erase suspend mode	Read erasing sector	1	No toggle	0	N/A	Toggle	1
	Read non-erasing sector	Data	Data	Data	Data	Data	1
	Program in erase suspend	$\overline{DQ7}$	Toggle	0	N/A	Toggle [†]	0
Exceeded time limits	Auto programming (byte)	$\overline{DQ7}$	Toggle	1	N/A	No toggle	1
	Program/erase in auto erase	0	Toggle	1	N/A	Toggle [†]	1
	Program in erase suspend (non-erase suspended sector)	$\overline{DQ7}$	Toggle	1	N/A	No toggle	1

DQ2 toggles when an erase-suspended sector is read repeatedly.

DQ6 toggles when any address is read repeatedly.

DQ2 = 1 if byte address being programmed is read during erase-suspend program mode.

[†]DQ2 toggles when the read address applied points to a sector which is undergoing erase, suspended erase, or a failure to erase.

Sector protect algorithm

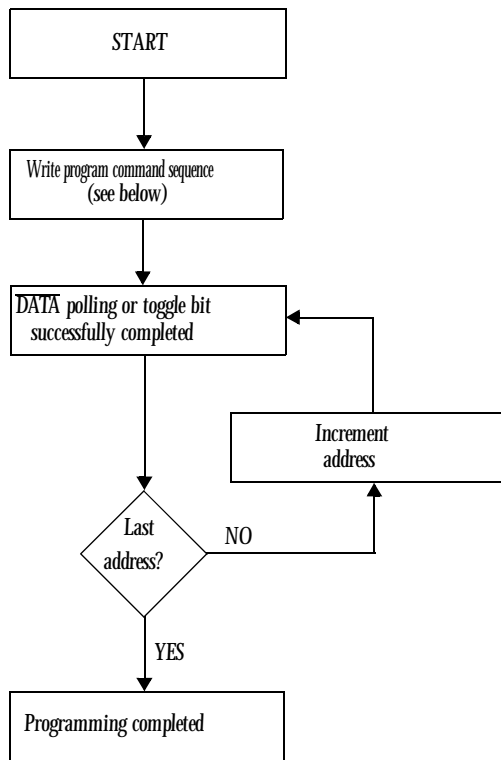

Sector unprotect algorithm

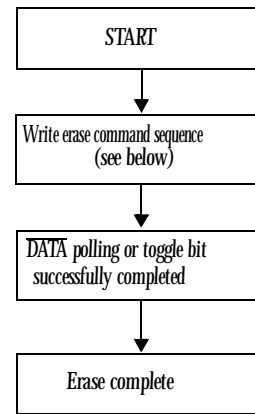

Automated on-chip programming algorithm

Program command sequence
×16 mode (address/data):

Automated on-chip erase algorithm

Chip erase command sequence
×16 mode (address/data):

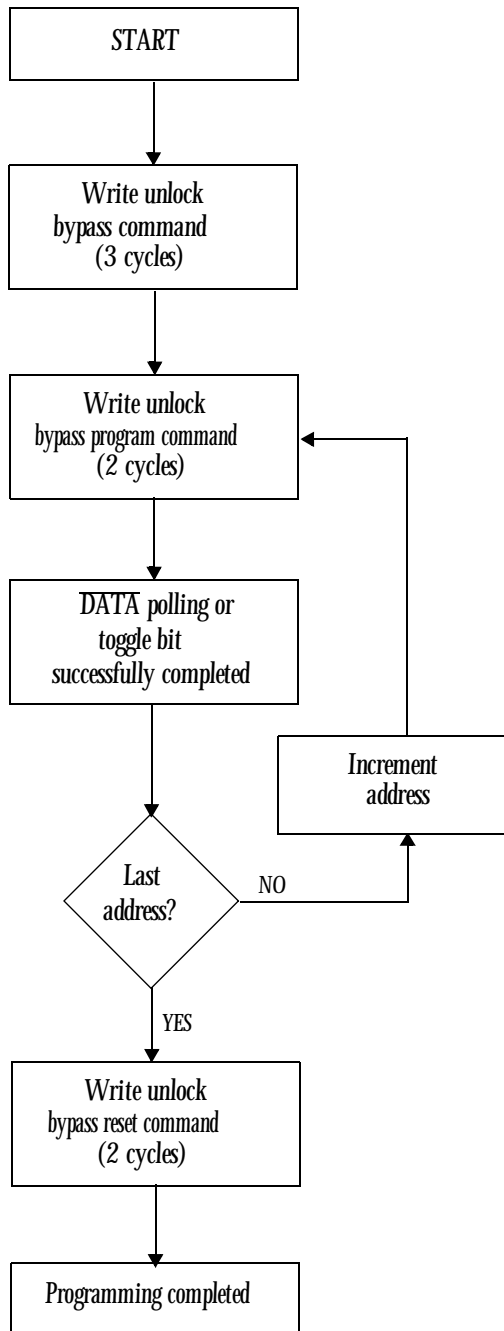

Individual sector/multiple sector
erase command sequence
×16 mode (address/data):

† The system software should check the status of DQ3 prior to and following each subsequent sector erase command to ensure command completion. The device may not have accepted the command if DQ3 is high on second status check.

Programming using unlock bypass command

Unlock bypass command sequence x16 mode (address/data)

Unlock bypass program command sequence x16 mode (address/data)

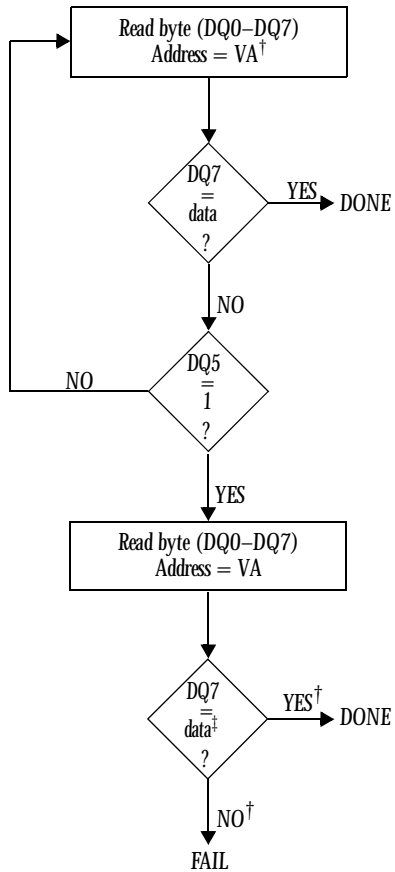

Unlock bypass reset command sequence x16 mode (address/data)

DATA polling algorithm

† VA = Byte address for programming. VA = any of the sector addresses within the sector being erased during Sector Erase. VA = valid address equals any non-protected sector group address during Chip Erase.

‡ DQ7 rechecked even if DQ5 = 1 because DQ5 and DQ7 may not change simultaneously.

Toggle bit algorithm

†DQ6 rechecked even if DQ5 = 1 because DQ6 may stop toggling when DQ5 changes to 1.

DC electrical characteristics

 $V_{CC} = 2.7-3.6V$

Parameter	Symbol	Test conditions	Min	Max	Unit
Input load current	I_{LI}	$V_{IN} = V_{SS}$ to V_{CC} , $V_{CC} = V_{CC\ MAX}$	-	± 1	μA
A9 Input load current	I_{LIT}	$V_{CC} = V_{CC\ MAX}$, A9 = 10V		35	μA
Output leakage current	I_{LO}	$V_{OUT} = V_{SS}$ to V_{CC} , $V_{CC} = V_{CC\ MAX}$	-	± 1	μA
Active current, read @ 5MHz	I_{CC1}	$\overline{CE} = V_{IL}$, $\overline{OE} = V_{IH}$	-	20	mA
Active current, program/erase	I_{CC2}	$\overline{CE} = V_{IL}$, $\overline{OE} = V_{IH}$	-	30	mA
Automatic sleep mode ¹	I_{CC3}	$\overline{CE} = V_{IL}$, $\overline{OE} = V_{IH}$; $V_{IL} = 0.3V$, $V_{IH} = V_{CC} - 0.3V$	-	5	μA
Standby current	I_{SB}	$\overline{CE} = V_{CC} - 0.3V$, $\overline{RESET} = V_{CC} - .3V$	-	5	μA
Deep power down current ³	I_{PD}	$\overline{RESET} = 0.3V$	-	5	μA
Input low voltage	V_{IL}		-0.5	0.8	V
Input high voltage	V_{IH}		$0.7 \times V_{CC}$	$V_{CC} + 0.3$	V
Output low voltage	V_{OL}	$I_{OL} = 4.0mA$, $V_{CC} = V_{CC\ MIN}$	-	0.45	V
Output high voltage	V_{OH}	$I_{OH} = -2.0\ mA$, $V_{CC} = V_{CC\ MIN}$	$0.85 \times V_{CC}$	-	V
Low V_{CC} lock out voltage	V_{LKO}		1.5	-	V
Input HV select voltage	V_{ID}		9	11	V

¹ Automatic sleep mode enables the deep power down mode when addresses are stable for 150 ns. Typical sleep mode current is 200 nA.

Chip programming time	-	7.2	27	sec	
Erase/program cycles ¹	-	100,000	-	cycles	

¹ Erase/program cycle test is not verified on each shipped unit.

Latchup tolerance

Parameter	Min	Max	Unit
Input voltage with respect to V_{SS} on A9, OE, and RESET pin	-1.0	+12.0	V
Input voltage with respect to V_{SS} on all DQ, address, and control pins	-0.5	$V_{CC}+0.5$	V
Current	-100	+100	mA

Includes all pins except V_{CC} . Test conditions: $V_{CC} = 3.0V$, one pin at a time.

Recommended operating conditions

Parameter	Symbol	Min	Max	Unit
Supply voltage	V_{CC}	+2.7	+3.6	V
	V_{SS}	0	0	V
Input voltage	V_{IH}	1.9	$V_{CC} + 0.3$	V
	V_{IL}	-0.5	0.8	V

Absolute maximum ratings

Parameter	Symbol	Min	Max	Unit
Input voltage (Input or DQ pin)	V_{IN}	-0.5	$V_{CC} + 0.5$	V
Input voltage (A9 pin, \overline{OE} , RESET)	V_{IN}	-0.5	+12.5	V
Power supply voltage	V_{CC}	-0.5	+4.0	V
Operating temperature	T_{OPR}	-55	+125	°C
Storage temperature (plastic)	T_{STG}	-65	+150	°C
Short circuit output current	I_{OUT}	-	150	mA

Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

TSOP pin capacitance

Symbol	Parameter	Test setup	Typ	Max	Unit
C_{IN}	Input capacitance	$V_{IN} = 0$	6	7.5	pF
C_{OUT}	Output capacitance	$V_{OUT} = 0$	8.5	12	pF
C_{IN2}	Control pin capacitance	$V_{IN} = 0$	8	10	pF

SO pin capacitance (availability TBD)

Symbol	Parameter	Test setup	Typ	Max	Unit
C_{IN}	Input capacitance	$V_{IN} = 0$	6	7.5	pF
C_{OUT}	Output capacitance	$V_{OUT} = 0$	8.5	12	pF
C_{IN2}	Control pin capacitance	$V_{IN} = 0$	8	10	pF

Data retention

Parameter	Temp. (°C)	Min	Unit
Minimum pattern data retention time	150°	10	years
	125°	20	years

Package dimensions:

Thin small outline package (TSOP-I)

	48-pin 12x20	
	Min	Max
A	-	1.27
A1	0.05	0.15
A2	0.95	1.05
b	0.17	0.27
c	0.15 nominal	
D	18.20	18.60
e	0.50 nominal	
E	11.90	12.10
Hd	19.80	20.20
L	0.50	0.70
α	0°	5°

Package dimensions:

Small Outline Plastic (SO) (availability TBD)

JEDEC MO - 175 AA
44-pin SO

	Min (mm)	Max (mm)
A	-	3.1
A1	0.05	-
A2	2.5	2.9
b	0.25	0.45
c	0.09	0.25
d	28.0	28.4
e	12.4	12.8
E	1.27 (typical)	
He	16.05 (typical)	
l	0.73	1.3
