

CMOS QUAD 3-STATE R-S LATCHES

FEATURES

- ◆ Separate Set and Reset Inputs for each Latch
- ◆ Active-High (4043 B) or Active-Low (4044 B) Inputs
- ◆ 3-State Outputs with Common Enable

DESCRIPTION

4043B types are Quad cross-coupled 3-state CMOS NOR Latches, and the 4044 B types are Quad cross-coupled 3-state CMOS NAND Latches. Each latch has a separate Q output and individual Set and Reset inputs. The Q outputs are gated through transmission gates controlled by a common Enable input. A logic "1" or "high" on the Enable input connects the latch states to the Q outputs. A logic "0" or "low" on the Enable input disconnects the latch states from the Q outputs, resulting in an open circuit condition on the Q outputs. The open circuit feature allows common bussing of the outputs. The logic operation of the latches is summarized in the truth table below.
