## SMOKE DETECTOR WITH INTERCONNECT

Dwg. PC-004-1

### ABSOLUTE MAXIMUM RATINGS (Voltages are referenced to $V_{SS}$ )

Supply Voltage Range,

$V_{DD}$  ..... **-0.5 V to +15 V**

Reverse Battery (10.5 V) ..... **20 s**

Input Voltage Range,

$V_{IN}$  ..... **-0.3 V to  $V_{DD} + 0.3$  V**

Input Current,  $I_{IN}$  ..... **10 mA**

Operating Temperature Range,

$T_A$  ..... **0°C to +50°C**

Storage Temperature Range,

$T_S$  ..... **-55°C to +125°C**

*CAUTION: CMOS devices have input static protection but are susceptible to damage when exposed to extremely high static electrical charges.*

The A5350CA is a low-current, CMOS circuit providing all of the required features for an ionization-type smoke detector. A networking capability allows as many as 125 units to be interconnected so that if any unit senses smoke, all units will sound an alarm. In addition, special features are incorporated to facilitate alignment and test of the finished smoke detector. This device is designed to comply with Underwriters Laboratories Specification UL217.

The internal oscillator and timing circuitry keeps standby power to a minimum by powering down the device for 1.66 seconds and sensing smoke for only 10 ms. Every 24 on/off cycles, a check is made for low battery condition. By substituting other types of sensors, or a switch for the ionization detector, this very-low power device can be used in numerous other battery-operated safety/security applications.

The A5350CA is supplied in a low-cost, 16-pin dual in-line plastic package. It is rated for continuous operation over the temperature range of 0°C to +50°C.

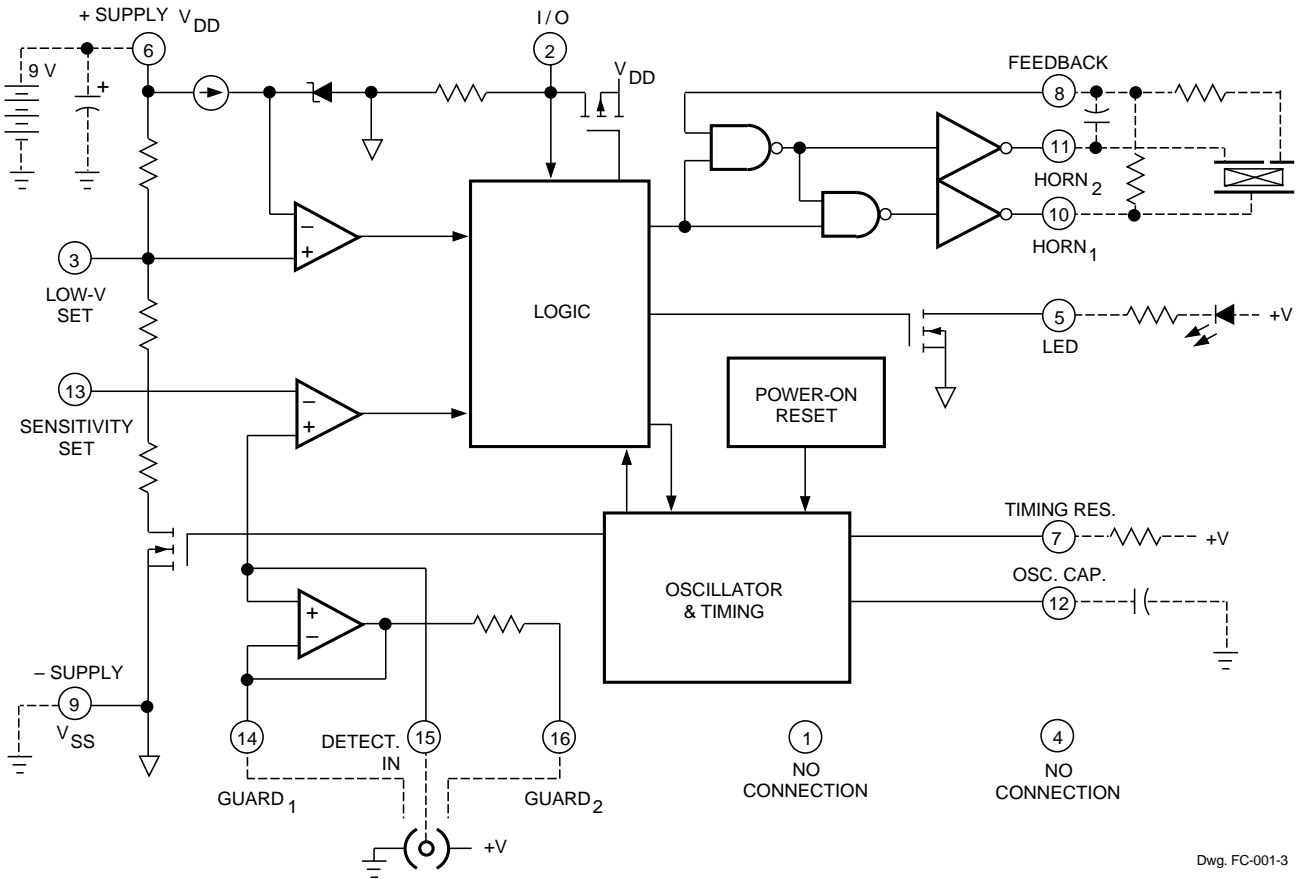

### FEATURES

- Interconnect Up to 125 Detectors
- Piezoelectric Horn Driver
- Guard Outputs for Detector Input
- Pulse Testing for Low Battery
- Power-ON Reset
- Internal Reverse Battery Protection

Always order by complete part number: **A5350CA** .

## CIRCUIT DESCRIPTION

The A5350CA is a low-current CMOS circuit providing all of the required features for an ionization-type smoke detector.

**Oscillator.** An internal oscillator operates with a period of 1.67 seconds during no-smoke conditions. Every 1.67 seconds, internal power is applied to the entire circuit and a check is made for smoke. Every 24 clock cycles (40 seconds), the LED is pulsed and a check is made for low battery by comparing  $V_{DD}$  to an internal reference. Since very-low currents are used in the device, the oscillator capacitor at pin 12 should be a low-leakage type (PTFE, polystyrene, or polypropylene).

**Detector Circuitry.** An active guard is provided on both pins adjacent to the detector input (pin 15). The voltage at pins 14 and 16 will be within 100 mV of the input. This will keep surface leakage currents to a minimum and provide a method of measuring the input voltage without loading the ionization chamber. The active guard amplifier is not power strobed and thus provides constant protection from surface leakage currents. The detector input has internal diode protection against static damage.

**Alarm Circuitry.** If smoke is detected, the oscillator period changes to 40 ms and the horn is enabled. The horn output is typically 160 ms ON, 80 ms OFF. During the OFF time, smoke is again checked and will inhibit further alarm output if smoke is not sensed. During smoke conditions the low battery alarm is inhibited and the LED is driven at a 1 Hz rate.

**Sensitivity Adjust.** The detector sensitivity must be externally adjusted to the individual characteristics of the ionization chamber by connecting resistors between pin 13 and  $V_{DD}$ , and between pin 13 and  $V_{SS}$ .

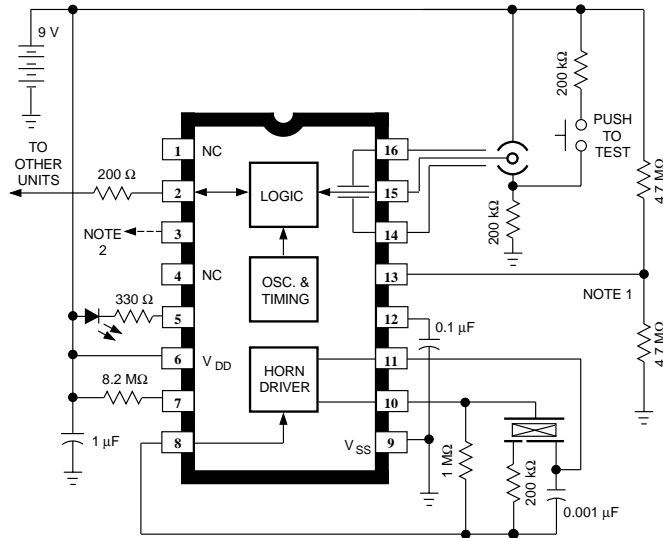

**Low Battery.** The low battery threshold is set internally by a voltage divider connected between  $V_{DD}$  and  $V_{SS}$ . The threshold can be increased by connecting a resistor between pin 3 and  $V_{DD}$ . The threshold can be decreased by connecting a resistor between pin 3 and  $V_{SS}$ . The battery voltage level is checked every 40 seconds during the 10 mA, 10 ms LED pulse. If an LED is not used, it should be replaced with an equivalent resistor (typically 500  $\Omega$  to 1000  $\Omega$ ) such that the battery loading remains at 10 mA.

**I/O.** A connection is provided at pin 2 to allow multiple smoke detectors to be commoned. If any single unit detects smoke (I/O is driven high), all connected units will sound their associated horns after a nominal 3 second delay. The LED is suppressed when an alarm is signaled from an interconnected unit.

**Testing.** On power up, all internal counters are reset. Internal test circuitry allows for low battery check by holding pins 8 and 12 low during power up, then reducing  $V_{DD}$  and monitoring HORN<sub>1</sub> (pin 10). All functional tests can be accelerated by driving pin 12 with a 2 kHz square wave. The 10 ms strobe period must be maintained for proper operation of the comparator circuitry.

## TYPICAL APPLICATION

Dwg. EC-005-3

NOTE 1: An external resistor divider is used to adjust sensitivity for the particular smoke chamber.

NOTE 2: A resistor to ground or  $V_{DD}$  may be added to this pin to modify low battery voltage threshold.
