Caution: These CMOS devices have input static protection (Class 3) but are still susceptible to damage if exposed to extremely high static electrical charges.

The A6B259KA and A6B259KLW combine a 3-to-8 line CMOS decoder and accompanying data latches, control circuitry, and DMOS outputs in a multi-functional power driver capable of storing single-line data in the addressable latches or use as a decoder or demuliplexer. Driver applications include relays, solenoids, and other medium-current or high-voltage peripheral power loads.

The CMOS inputs and latches allow direct interfacing with micro-processor-based systems. Use with TTL may require appropriate pull-up resistors to ensure an input logic high. Four modes of operation are selectable with the CLEAR and ENABLE inputs.

The A6B259KA/KLW DMOS open-drain outputs are capable of sinking up to 500 mA. Similar devices with reduced $r_{DS(on)}$ are available as the A6259KA/KLW.

The A6B259KA is furnished in a 20-pin dual in-line plastic package. The A6B259KLW is furnished in a 20-lead wide-body, small-outline plastic package (SOIC) with gull-wing leads for surface-mount applications. Copper lead frames, reduced supply current requirements, and low on-state resistance allow either device to sink 150 mA from all outputs continuously, to ambient temperatures greater than 85°C.

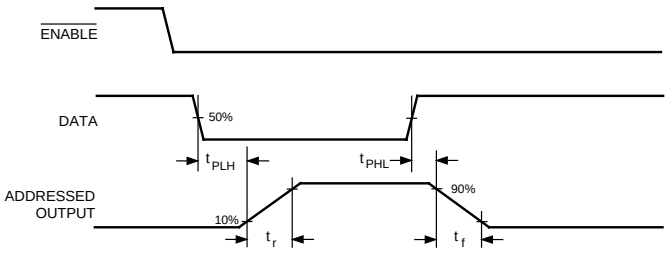
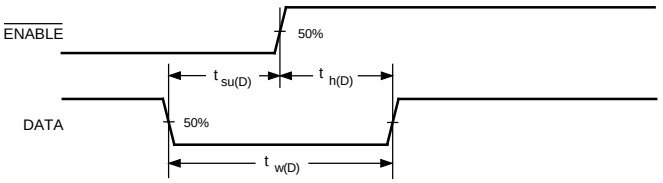
FUNCTIONAL DESCRIPTION and INPUT REQUIREMENTS



Dwg. WP-036

OUTPUT SWITCHING TIME



Dwg. WP-037

DATA INPUT REQUIREMENTS

Data Active Time Before Enable (Data Set-Up Time), $t_{su(D)}$ ..... **20 ns**
Data Active Time After Enable (Data Hold Time), $t_{h(D)}$ ..... **20 ns**
Data Pulse Width, $t_{w(D)}$ ..... **40 ns**
Input Logic High, V_{IH} ..... $\geq$ **0.85V_{CC}**
Input Logic Low, V_{IL} ..... $\leq$ **0.15V_{CC}**

Four modes of operation are selectable by controlling the CLEAR and ENABLE inputs as shown above.

In the addressable-latch mode, data at the DATA input is written into the addressed transparent latch. The addressed output inverts the data input with all other outputs remaining in their previous states.

In the memory mode, all outputs remain in their previous states and are unaffected by the DATA or address (S_n) inputs. To prevent entering erroneus data in the latches, ENABLE should be held HIGH while the address lines are changing.

In the demultiplexing/decoding mode, the addressed output inverts the data input and all other outputs are OFF.

In the clear mode, all outputs are OFF and are unaffected by the DATA or address (S_N) inputs.

Given the appropriate inputs, when DATA is LOW for a given address, the output is OFF; when DATA is HIGH, the output is ON and can sink current.
