### 3.0 SIGNALS

Table 6. Signal Descriptions

Signal Name	Type	Description	Alternate Function
A17	O	<b>18th Address Bit (A17).</b> Output to memory as 18th external address bit (A17) in extended bus applications, depending on the values of bits RD0 and RD1 in configuration byte UCONFIG0 (see Chapter 4, "Device Configuration," of the 8XC251SA/SB/SP/SQ Embedded Microcontroller User's Manual). See also RD# and PSEN#.	P1.7/CEX4/ WCLK
A16	O	<b>Address Line 16.</b> See RD#.	RD#
A15:8 <sup>†</sup>	O	<b>Address Lines.</b> Upper address lines for the external bus.	P2.7:0
AD7:0 <sup>†</sup>	I/O	<b>Address/Data Lines.</b> Multiplexed lower address lines and data lines for external memory.	P0.7:0
ALE	O	<b>Address Latch Enable.</b> ALE signals the start of an external bus cycle and indicates that valid address information is available on lines A15:8 and AD7:0. An external latch can use ALE to demultiplex the address from the address/data bus.	PROG#
CEX4:0	I/O	<b>Programmable Counter Array (PCA) Input/Output Pins.</b> These are input signals for the PCA capture mode and output signals for the PCA compare mode and PCA PWM mode.	P1.6:3 P1.7/A17/ WAIT#
EA#	I	<b>External Access.</b> Directs program memory accesses to on-chip or off-chip code memory. For EA# = 0, all program memory accesses are off-chip. For EA# = 1, an access is to on-chip ROM/OTPROM/EPROM if the address is within the range of the on-chip ROM/OTPROM/EPROM; otherwise the access is off-chip. The value of EA# is latched at reset. For devices without on-chip ROM/OTPROM/EPROM, EA# must be strapped to ground.	V <sub>PP</sub>
ECI	I	<b>PCA External Clock Input.</b> External clock input to the 16-bit PCA timer.	P1.2
INT1:0#	I	<b>External Interrupts 0 and 1.</b> These inputs set bits IE1:0 in the TCON register. If bits IT1:0 in the TCON register are set, bits IE1:0 are set by a falling edge on INT1#/INT0#. If bits INT1:0 are clear, bits IE1:0 are set by a low level on INT1:0#.	P3.3:2
PROG#	I	<b>Programming Pulse.</b> The programming pulse is applied to this pin for programming the on-chip OTPROM.	ALE
P0.7:0	I/O	<b>Port 0.</b> This is an 8-bit, open-drain, bidirectional I/O port.	AD7:0
P1.0 P1.1 P1.2 P1.7:3	I/O	<b>Port 1.</b> This is an 8-bit, bidirectional I/O port with internal pullups.	T2 T2EX ECI CEX3:0 CEX4/A17/ WAIT#/ WCLK
P2.7:0	I/O	<b>Port 2.</b> This is an 8-bit, bidirectional I/O port with internal pullups.	A15:8

<sup>†</sup> The descriptions of A15:8/P2.7:0 and AD7:0/P0.7:0 are for the nonpage-mode chip configuration (compatible with 44-pin PLCC and 40-pin DIP MCS 51 microcontrollers). If the chip is configured for page-mode operation, port 0 carries the lower address bits (A7:0), and port 2 carries the upper address bits (A15:8) and the data (D7:0).

**Table 6. Signal Descriptions (Continued)**

Signal Name	Type	Description	Alternate Function
P3.0 P3.1 P3.3:2 P3.5:4 P3.6 P3.7	I/O	<b>Port 3.</b> This is an 8-bit, bidirectional I/O port with internal pullups.	RXD TXD INT1:0# T1:0 WR# RD#/A16
PSEN#	O	<b>Program Store Enable.</b> Read signal output. This output is asserted for a memory address range that depends on bits RD0 and RD1 in configuration byte UCONFIG0 (see RD# and Chapter 4, "Device Configuration," in the 8XC251SA/SB/SP/SQ Embedded Microcontroller User's Manual).	—
RD#	O	<b>Read or 17th Address Bit (A16).</b> Read signal output to external data memory or 17th external address bit (A16), depending on the values of bits RD0 and RD1 in configuration byte UCONFIG0. (See PSEN# and Chapter 4, "Device Configuration," in the 8XC251SA/SB/SP/SQ Embedded Microcontroller User's Manual).	P3.7/A16
RST	I	<b>Reset.</b> Reset input to the chip. Holding this pin high for 64 oscillator periods while the oscillator is running resets the device. The port pins are driven to their reset conditions when a voltage greater than $V_{IH1}$ is applied, whether or not the oscillator is running. This pin has an internal pulldown resistor, which allows the device to be reset by connecting a capacitor between this pin and $V_{CC}$ . Asserting RST when the chip is in idle mode or powerdown mode returns the chip to normal operation.	—
RXD	I/O	<b>Receive Serial Data.</b> RXD sends and receives data in serial I/O mode 0 and receives data in serial I/O modes 1, 2, and 3.	P3.0
T1:0	I	<b>Timer 1:0 External Clock Inputs.</b> When timer 1:0 operates as a counter, a falling edge on the T1:0 pin increments the count.	P3.5:4
T2	I/O	<b>Timer 2 Clock Input/Output.</b> For the timer 2 capture mode, this signal is the external clock input. For the clock-out mode, it is the timer 2 clock output.	P1.0
T2EX	I	<b>Timer 2 External Input.</b> In timer 2 capture mode, a falling edge initiates a capture of the timer 2 registers. In auto-reload mode, a falling edge causes the timer 2 registers to be reloaded. In the up-down counter mode, this signal determines the count direction: 1 = up, 0 = down.	P1.1
TXD	O	<b>Transmit Serial Data.</b> TXD outputs the shift clock in serial I/O mode 0 and transmits serial data in serial I/O modes 1, 2, and 3.	P3.1
$V_{CC}$	PWR	<b>Supply Voltage.</b> Connect this pin to the +5V supply voltage.	—
$V_{CC2}$	PWR	<b>Secondary Supply Voltage 2.</b> This supply voltage connection is provided to reduce power supply noise. Connection of this pin to the +5V supply voltage is recommended. However, when using the 8XC251SB as a pin-for-pin replacement for the 8XC51FX, $V_{SS2}$ can be unconnected without loss of compatibility. (Not available on DIP)	—

† The descriptions of A15:8/P2.7:0 and AD7:0/P0.7:0 are for the nonpage-mode chip configuration (compatible with 44-pin PLCC and 40-pin DIP MCS 51 microcontrollers). If the chip is configured for page-mode operation, port 0 carries the lower address bits (A7:0), and port 2 carries the upper address bits (A15:8) and the data (D7:0).

Table 6. Signal Descriptions (Continued)

V <sub>SS</sub>	GND	<b>Circuit Ground.</b> Connect this pin to ground.	—
V <sub>SS1</sub>	GND	<b>Secondary Ground.</b> This ground is provided to reduce ground bounce and improve power supply bypassing. Connection of this pin to ground is recommended. However, when using the 8XC251SA/SB/SP/SQ as a pin-for-pin replacement for the 8XC51BH, V <sub>SS1</sub> can be unconnected without loss of compatibility. (Not available on DIP)	—
V <sub>SS2</sub>	GND	<b>Secondary Ground 2.</b> This ground is provided to reduce ground bounce and improve power supply bypassing. Connection of this pin to ground is recommended. However, when using the 8XC251SB as a pin-for-pin replacement for the 8XC51FX, V <sub>SS2</sub> can be unconnected without loss of compatibility. (Not available on DIP)	—
WAIT#	I	<b>Real-time Wait State Input.</b> The real-time WAIT# input is enabled by writing a logical '1' to the WCON.0 (RTWE) bit at S:A7H. During bus cycles, the external memory system can signal 'system ready' to the microcontroller in real time by controlling the WAIT# input signal on the port 1.6 input.	P1.6/CEX3
WCLK	O	<b>Wait Clock Output.</b> The real-time WCLK output is driven at port 1.7 (WCLK) by writing a logical '1' to the WCON.1 (RTWCE) bit at S:A7H. When enabled, the WCLK output produces a square wave signal with a period of one-half the oscillator frequency.	P1.7/CEX4/A17
WR#	O	<b>Write.</b> Write signal output to external memory.	P3.6
XTAL1	I	<b>Input to the On-chip, Inverting, Oscillator Amplifier.</b> To use the internal oscillator, a crystal/resonator circuit is connected to this pin. If an external oscillator is used, its output is connected to this pin. XTAL1 is the clock source for internal timing.	—
XTAL2	O	<b>Output of the On-chip, Inverting, Oscillator Amplifier.</b> To use the internal oscillator, a crystal/resonator circuit is connected to this pin. If an external oscillator is used, leave XTAL2 unconnected.	—

### NOTES:

- 18 address lines are bonded out (A15:0, A16:0, or A17:0 selected during chip configuration).
- The special function registers (SFRs) and the register file have separate internal address spaces.
- Data in this area is accessible by indirect addressing only.
- Devices reset into internal or external starting locations depending on the state of EA# and configuration byte information. See EA#. See also UCONFIG1:0 bit definitions in the 8XC251SA/SB/SP/SQ Embedded Microcontroller User's Manual.
- The 16-Kbyte ROM/OTPROM/EPROM devices allow internal locations FF:2000H–FF:3FFFH to map into region 00:. In this case, if EA# = 1, a data read to 00:E000H–00:FFFFH is redirected to internal ROM/OTPROM/EPROM (see bit 1 in UCONFIG0). This is not available for 8-Kbyte ROM/OTPROM/EPROM devices.
- This reserved area returns indeterminate values.
- Data is accessible by direct and indirect addressing.
- Data is accessible by direct, indirect, and bit addressing.
- Data is accessible by direct, indirect, and register addressing.
- Eight addresses at the top of all external memory maps are reserved for current and future device configuration byte information.

## 5.1 D.C. Characteristics

Parameter values apply to all devices unless otherwise indicated.

**Table 9. DC Characteristics at  $V_{CC} = 4.5 - 5.5$  V**

Symbol	Parameter	Min	Typical	Max	Units	Test Conditions
$V_{IL}$	Input Low Voltage (except EA#)	-0.5		$0.2V_{CC} - 0.1$	V	
$V_{IL1}$	Input Low Voltage (EA#)	0		$0.2V_{CC} - 0.3$	V	
$V_{IH}$	Input High Voltage (except XTAL1, RST)	$0.2V_{CC} + 0.9$		$V_{CC} + 0.5$	V	
$V_{IH1}$	Input High Voltage (XTAL1, RST)	$0.7V_{CC}$		$V_{CC} + 0.5$	V	
$V_{OL}$	Output Low Voltage (Port 1, 2, 3)			0.3 0.45 1.0	V	$I_{OL} = 100 \mu\text{A}$ $I_{OL} = 1.6 \text{ mA}$ $I_{OL} = 3.5 \text{ mA}$ (Note 1, Note 2)
$V_{OL1}$	Output Low Voltage (Port 0, ALE, PSEN#)			0.3 0.45 1.0	V	$I_{OL} = 200 \mu\text{A}$ $I_{OL} = 3.2 \text{ mA}$ $I_{OL} = 7.0 \text{ mA}$ (Note 1, Note 2)
$V_{OH}$	Output High Voltage (Port 1, 2, 3, ALE, PSEN#)	$V_{CC} - 0.3$ $V_{CC} - 0.7$ $V_{CC} - 1.5$			V	$I_{OH} = -10 \mu\text{A}$ $I_{OH} = -30 \mu\text{A}$ $I_{OH} = -60 \mu\text{A}$ (Note 3)

### NOTES:

- Under steady-state (non-transient) conditions,  $I_{OL}$  must be externally limited as follows:

Maximum  $I_{OL}$  per port pin: 10 mA

Maximum  $I_{OL}$  per 8-bit port:

port 0 26 mA

ports 1–3 15 mA

Maximum Total  $I_{OL}$  for

all output pins 71 mA

If  $I_{OL}$  exceeds the test conditions,  $V_{OL}$  may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

- Capacitive loading on ports 0 and 2 may cause spurious noise pulses above 0.4 V on the low-level outputs of ALE and ports 1, 2, and 3. The noise is due to external bus capacitance discharging into the port 0 and port 2 pins when these pins change from high to low. In applications where capacitive loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8 V. It may be desirable to qualify ALE or other signals with a Schmitt trigger or CMOS-level input logic.
- Capacitive loading on ports 0 and 2 causes the  $V_{OH}$  on ALE and PSEN# to drop below the specification when the address lines are stabilizing.
- Typical values are obtained using  $V_{CC} = 5.0$ ,  $T_A = 25^\circ\text{C}$  and are not guaranteed.

$I_{DL}$	Idle Mode Current		12 (Note 4)	15	mA	$F_{OSC} = 16 \text{ MHz}$
$I_{CC}$	Operating Current		45 (Note 4)	80	mA	$F_{OSC} = 16 \text{ MHz}$

**NOTES:**

- Under steady-state (non-transient) conditions,  $I_{OL}$  must be externally limited as follows:

Maximum  $I_{OL}$  per port pin: 10 mA

Maximum  $I_{OL}$  per 8-bit port:

port 0           26 mA

ports 1-3       15 mA

Maximum Total  $I_{OL}$  for  
all output pins           71 mA

If  $I_{OL}$  exceeds the test conditions,  $V_{OL}$  may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

- Capacitive loading on ports 0 and 2 may cause spurious noise pulses above 0.4 V on the low-level outputs of ALE and ports 1, 2, and 3. The noise is due to external bus capacitance discharging into the port 0 and port 2 pins when these pins change from high to low. In applications where capacitive loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8 V. It may be desirable to qualify ALE or other signals with a Schmitt trigger or CMOS-level input logic.
- Capacitive loading on ports 0 and 2 causes the  $V_{OH}$  on ALE and PSEN# to drop below the specification when the address lines are stabilizing.
- Typical values are obtained using  $V_{CC} = 5.0$ ,  $T_A = 25^\circ\text{C}$  and are not guaranteed.
