

8XC52/54/58 CHMOS SINGLE-CHIP 8-BIT MICROCONTROLLER

Commercial/Express

87C52/80C52/80C32/87C54/80C54/87C58/80C58

*See Table 1 for Proliferation Options

- High Performance CHMOS EPROM/ROM/CPU
- 12/24/33 MHz Operations
- Three 16-Bit Timer/Counters
- Programmable Clock Out
- Up/Down Timer/Counter
- Three Level Program Lock System
- 8K/16K/32K On-Chip Program Memory
- 256 Bytes of On-Chip Data RAM
- Improved Quick Pulse Programming Algorithm
- Boolean Processor
- 32 Programmable I/O Lines
- 6 Interrupt Sources
- Programmable Serial Channel with:
 - Framing Error Detection
 - Automatic Address Recognition
- TTL and CMOS Compatible Logic Levels
- 64K External Program Memory Space
- 64K External Data Memory Space
- MCS® 51 Microcontroller Compatible Instruction Set
- Power Saving Idle and Power Down Modes
- ONCE (On-Circuit Emulation) Mode
- Four-Level Interrupt Priority
- Extended Temperature Range Except for 33 MHz Offering (–40°C to +85°C)

MEMORY ORGANIZATION

ROM Device	EPROM Version	ROMless Version	ROM/EPROM Bytes	RAM Bytes
80C52	87C52	80C32	8K	256
80C54	87C54	80C32	16K	256
80C58	87C58	80C32	32K	256

These devices can address up to 64 Kbytes of external program/data memory.

The Intel 8XC52/8XC54/8XC58 is a single-chip control-oriented microcontroller which is fabricated on Intel's reliable CHMOS III-E technology. Being a member of the MCS 51 family of controllers, the 8XC52/8XC54/8XC58 uses the same powerful instruction set, has the same architecture, and is pin-for-pin compatible with the existing MCS 51 family of products. The 8XC52/8XC54/8XC58 is an enhanced version of the 87C51/80C51BH/80C31BH. The added features make it an even more powerful microcontroller for applications that require clock output, and up/down counting capabilities such as motor control. It also has a more versatile serial channel that facilitates multi-processor communications.

Throughout this document 8XC5X will refer to the 8XC52, 80C32, 8XC54 and 8XC58 unless information applies to a specific device.

*Other brands and names are the property of their respective owners. Information in this document is provided in connection with Intel products. Intel assumes no liability whatsoever, including infringement of any patent or copyright, for sale and use of Intel products except as provided in Intel's Terms and Conditions of Sale for such products. Intel retains the right to make changes to these specifications at any time, without notice. Microcomputer Products may have minor variations to this specification known as errata.

PROCESS INFORMATION

This device is manufactured on P629.0, a CHMOS III-E process. Additional process and reliability information is available in Intel's *Components Quality and Reliability Handbook*, Order No. 210997.

PACKAGES

Part	Prefix	Package Type
8XC5X	P	40-Pin Plastic DIP (OTP)
87C5X	D	40-Pin CERDIP (EPROM)
8XC5X	N	44-Pin PLCC (OTP)
8XC5X	S	44-Pin QFP (OTP)

Figure 2. Pin Connections

PIN DESCRIPTIONS

V_{CC}: Supply voltage.

V_{SS}: Circuit ground.

V_{SS1}: Secondary ground (not on DIP). Provided to reduce ground bounce and improve power supply by-passing.

NOTE:

This pin is not a substitute for the V_{SS} pin (pin 22). (Connection not necessary for proper operation.)

Port 0: Port 0 is an 8-bit, open drain, bidirectional I/O port. As an output port each pin can sink several LS TTL inputs. Port 0 pins that have 1's written to them float, and in that state can be used as high-impedance inputs.

Port 0 is also the multiplexed low-order address and data bus during accesses to external Program and Data Memory. In this application it uses strong internal pullups when emitting 1's, and can source and sink several LS TTL inputs.

Port 0 also receives the code bytes during EPROM programming, and outputs the code bytes during program verification. External pullup resistors are required during program verification.

Port 1: Port 1 is an 8-bit bidirectional I/O port with internal pullups. The Port 1 output buffers can drive LS TTL inputs. Port 1 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 1 pins that are externally pulled low will source current (I_{IL}, on the data sheet) because of the internal pullups.

In addition, Port 1 serves the functions of the following special features of the 8XC5X:

Port Pin	Alternate Function
P1.0	T2 (External Count Input to Timer/Counter 2), Clock-Out
P1.1	T2EX (Timer/Counter 2 Capture/Reload Trigger and Direction Control)

Port 1 receives the low-order address bytes during EPROM programming and verifying.

Port 2: Port 2 is an 8-bit bidirectional I/O port with internal pullups. The Port 2 output buffers can drive LS TTL inputs. Port 2 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 2

pins that are externally pulled low will source current (I_{IL}, on the data sheet) because of the internal pullups.

Port 2 emits the high-order address byte during fetches from external Program Memory and during accesses to external Data Memory that use 16-bit addresses (MOVX @DPTR). In this application it uses strong internal pullups when emitting 1's. During accesses to external Data Memory that use 8-bit addresses (MOVX @Ri), Port 2 emits the contents of the P2 Special Function Register.

Some Port 2 pins receive the high-order address bits during EPROM programming and program verification.

Port 3: Port 3 is an 8-bit bidirectional I/O port with internal pullups. The Port 3 output buffers can drive LS TTL inputs. Port 3 pins that have 1's written to them are pulled high by the internal pullups, and in that state can be used as inputs. As inputs, Port 3 pins that are externally pulled low will source current (I_{IL}, on the data sheet) because of the pullups.

Port 3 also serves the functions of various special features of the 8051 Family, as listed below:

Port Pin	Alternate Function
P3.0	RXD (serial input port)
P3.1	TXD (serial output port)
P3.2	$\overline{\text{INT0}}$ (external interrupt 0)
P3.3	$\overline{\text{INT1}}$ (external interrupt 1)
P3.4	T0 (Timer 0 external input)
P3.5	T1 (Timer 1 external input)
P3.6	$\overline{\text{WR}}$ (external data memory write strobe)
P3.7	$\overline{\text{RD}}$ (external data memory read strobe)

RST: Reset input. A high on this pin for two machine cycles while the oscillator is running resets the device. The port pins will be driven to their reset condition when a minimum V_{IHI} voltage is applied whether the oscillator is running or not. An internal pulldown resistor permits a power-on reset with only a capacitor connected to V_{CC}.

ALE: Address Latch Enable output pulse for latching the low byte of the address during accesses to external memory. This pin (ALE/PROG) is also the program pulse input during EPROM programming for the 87C5X.

In normal operation ALE is emitted at a constant rate of 1/6 the oscillator frequency, and may be used for external timing or clocking purposes. Note, however, that one ALE pulse is skipped during each access to external Data Memory.

If desired, ALE operation can be disabled by setting bit 0 of SFR location 8EH. With this bit set, the pin is weakly pulled high. However, the ALE disable feature will be suspended during a MOVX or MOVC instruction, idle mode, power down mode and ICE mode. The ALE disable feature will be terminated by reset. When the ALE disable feature is suspended or terminated, the ALE pin will no longer be pulled up weakly. Setting the ALE-disable bit has no affect if the microcontroller is in external execution mode.

Throughout the remainder of this data sheet, ALE will refer to the signal coming out of the ALE/PROG pin, and the pin will be referred to as the ALE/PROG pin.

PSEN: Program Store Enable is the read strobe to external Program Memory.

When the 8XC5X is executing code from external Program Memory, $\overline{\text{PSEN}}$ is activated twice each machine cycle, except that two $\overline{\text{PSEN}}$ activations are skipped during each access to external Data Memory.

$\overline{\text{EA}}/\text{Vpp}$: External Access enable. $\overline{\text{EA}}$ must be strapped to VSS in order to enable the device to fetch code from external Program Memory locations 0000H to 0FFFFH. Note, however, that if any of the Lock bits are programmed, $\overline{\text{EA}}$ will be internally latched on reset.

$\overline{\text{EA}}$ should be strapped to V_{CC} for internal program executions.

This pin also receives the programming supply voltage (V_{PP}) during EPROM programming.

XTAL1: Input to the inverting oscillator amplifier.

XTAL2: Output from the inverting oscillator amplifier.

OSCILLATOR CHARACTERISTICS

XTAL1 and XTAL2 are the input and output, respectively, of a inverting amplifier which can be configured for use as an on-chip oscillator, as shown in Figure 3. Either a quartz crystal or ceramic resonator may be used. More detailed information concerning the use of the on-chip oscillator is available in Application Note AP-155, "Oscillators for Microcontrollers", Order No. 230659.

Figure 3. Oscillator Connections

To drive the device from an external clock source, XTAL1 should be driven, while XTAL2 floats, as shown in Figure 4. There are no requirements on the duty cycle of the external clock signal, since the input to the internal clocking circuitry is through a divide-by-two flip-flop, but minimum and maximum high and low times specified on the data sheet must be observed.

An external oscillator may encounter as much as a 100 pF load at XTAL1 when it starts up. This is due to interaction between the amplifier and its feedback capacitance. Once the external signal meets the V_{IL} and V_{IH} specifications the capacitance will not exceed 20 pF.

Figure 4. External Clock Drive Configuration

IDLE MODE

The user's software can invoke the Idle Mode. When the microcontroller is in this mode, power consumption is reduced. The Special Function Registers and the onboard RAM retain their values during Idle, but the processor stops executing instructions. Idle Mode will be exited if the chip is reset or if an enabled interrupt occurs.

Table 2. Status of the External Pins during Idle and Power Down

Mode	Program Memory	ALE	$\overline{\text{PSEN}}$	PORT0	PORT1	PORT2	PORT3
Idle	Internal	1	1	Data	Data	Data	Data
Idle	External	1	1	Float	Data	Address	Data
Power Down	Internal	0	0	Data	Data	Data	Data
Power Down	External	0	0	Float	Data	Data	Data

POWER DOWN MODE

To save even more power, a Power Down mode can be invoked by software. In this mode, the oscillator is stopped and the instruction that invoked Power Down is the last instruction executed. The on-chip RAM and Special Function Registers retain their values until the Power Down mode is terminated.

On the 8XC5X either a hardware reset or an external interrupt can cause an exit from Power Down. Reset redefines all the SFRs but does not change the on-chip RAM. An external interrupt allows both the SFRs and on-chip RAM to retain their values.

To properly terminate Power Down, the reset or external interrupt should not be executed before V_{CC} is restored to its normal operating level, and must be held active long enough for the oscillator to restart and stabilize (normally less than 10 ms).

With an external interrupt, INT0 and INT1 must be enabled and configured as level-sensitive. Holding the pin low restarts the oscillator but bringing the pin back high completes the exit. Once the interrupt is serviced, the next instruction to be executed after RETI will be the one following the instruction that put the device into Power Down.

DESIGN CONSIDERATION

- The window on the D87C5X must be covered by an opaque label. Otherwise, the DC and AC characteristics may not be met, and the device may be functionally impaired.

NOTE:

For more detailed information on the reduced power modes refer to current Embedded Microcontrollers and Processors Handbook Volume I, (Order No. 270645) and Application Note AP-252 (Embedded Applications Handbook, Order No. 270648), "Designing with the 80C51BH."

- When the idle mode is terminated by a hardware reset, the device normally resumes program execution, from where it left off, up to two machine cycles before the internal reset algorithm takes control. On-chip hardware inhibits access to internal RAM in this event, but access to the port pins is not inhibited. To eliminate the possibility of an unexpected write when Idle is terminated by reset, the instruction following the one that invokes Idle should not be one that writes to a port pin or to external memory.

ONCE MODE

The ONCE ("On-Circuit Emulation") Mode facilitates testing and debugging of systems using the 8XC5X without the 8XC5X having to be removed from the circuit. The ONCE Mode is invoked by:

- 1) Pull ALE low while the device is in reset and $\overline{\text{PSEN}}$ is high;
- 2) Hold ALE low as RST is deactivated.

While the device is in ONCE Mode, the Port 0 pins float and the other port pins and ALE and $\overline{\text{PSEN}}$ are weakly pulled high. The oscillator circuit remains active. While the 8XC5X is in this mode, an emulator or test CPU can be used to drive the circuit. Normal operation is restored when a normal reset is applied.

8XC5X EXPRESS

The Intel EXPRESS system offers enhancements to the operational specifications of the MCS 51 family of microcontrollers. These EXPRESS products are designed to meet the needs of those applications whose operating requirements exceed commercial standards.

The EXPRESS program includes the commercial standard temperature range with burn-in and an extended temperature range with or without burn-in.

With the commercial standard temperature range, operational characteristics are guaranteed over the temperature range of 0°C to +70°C. With the extended temperature range option, operational characteristics are guaranteed over the range of -40°C to +85°C.

The optional burn-in is dynamic for a minimum time of 168 hours at 125°C with $V_{CC} = 6.9V \pm 0.25V$, following guidelines in MIL-STD-883, Method 1015.

Package types and EXPRESS versions are identified by a one- or two-letter prefix to the part number. The prefixes are listed in Table 3.

For the extended temperature range option, this data sheet specifies the parameters which deviate from their commercial temperature range limits.

NOTE:

Intel offers Express Temperature specifications for all 8XC5X speed options except for 33 MHz.

Table 3. Prefix Identification

Prefix	Package Type	Temperature Range	Burn-In
P	Plastic	Commercial	No
D	Cerdip	Commercial	No
N	PLCC	Commercial	No
S	QFP	Commercial	No
TP	Plastic	Extended	No
TD	Cerdip	Extended	No
TN	PLCC	Extended	No
TS	QFP	Extended	No
LP	Plastic	Extended	Yes
LD	Cerdip	Extended	Yes
LN	PLCC	Extended	Yes
LS	QFP	Extended	Yes

NOTE:

Contact distributor or local sales office to match EXPRESS prefix with proper device.

EXAMPLES:

P80C52 indicates 80C52 in a plastic package and specified for commercial temperature range, without burn-in. TD80C52 indicates 80C52 in a Cerdip package and specified for extended temperature range, without burn-in.

ABSOLUTE MAXIMUM RATINGS*

Ambient Temperature Under Bias -40°C to $+85^{\circ}\text{C}$
 Storage Temperature -65°C to $+150^{\circ}\text{C}$
 Voltage on EA/ V_{PP} Pin to V_{SS} 0V to $+13.0\text{V}$
 Voltage on Any Other Pin to V_{SS} -0.5V to $+6.5\text{V}$
 I_{OL} Per I/O Pin 15 mA
 Power Dissipation 1.5W
 (based on PACKAGE heat transfer limitations, not device power consumption)

NOTICE: This data sheet contains preliminary information on new products in production. The specifications are subject to change without notice. Verify with your local Intel Sales office that you have the latest data sheet before finalizing a design.

**WARNING: Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.*

OPERATING CONDITIONS

Symbol	Description	Min	Max	Units
T_A	Ambient Temperature Under Bias Commercial Express	0	+70	$^{\circ}\text{C}$
		-40	+85	$^{\circ}\text{C}$
V_{CC}	Supply Voltage 8XC5X-33	4.0	6.0	V
		4.5	5.5	V
f_{OSC}	Oscillator Frequency			
	8XC5X	3.5	12	MHz
	8XC5X-1	3.5	16	MHz
	8XC5X-2	0.5	12	MHz
	8XC5X-24	3.5	24	MHz
8XC5X-33	3.5	33	MHz	

DC CHARACTERISTICS (Over Operating Conditions)

All parameter values apply to all devices unless otherwise indicated.

Symbol	Parameter	Min	Typ (Note 4)	Max	Unit	Test Conditions
V_{IL}	Input Low Voltage	-0.5		$0.2 V_{CC} - 0.1$	V	
V_{IL1}	Input Low Voltage $\overline{\text{EA}}$	0		$0.2 V_{CC} - 0.3$	V	
V_{IH}	Input High Voltage (Except XTAL1, RST)	$0.2 V_{CC} + 0.9$		$V_{CC} + 0.5$	V	
V_{IH1}	Input High Voltage (XTAL1, RST)	$0.7 V_{CC}$		$V_{CC} + 0.5$	V	
V_{OL}	Output Low Voltage (Note 5) (Ports 1, 2 and 3)			0.3	V	$I_{OL} = 100\ \mu\text{A}$ (Note 1)
				0.45	V	$I_{OL} = 1.6\ \text{mA}$ (Note 1)
				1.0	V	$I_{OL} = 3.5\ \text{mA}$ (Note 1)
V_{OL1}	Output Low Voltage (Note 5) (Port 0, ALE, PSEN)			0.3	V	$I_{OL} = 200\ \mu\text{A}$ (Note 1)
				0.45	V	$I_{OL} = 3.2\ \text{mA}$ (Note 1)
				1.0	V	$I_{OL} = 7.0\ \text{mA}$ (Note 1)
V_{OH}	Output High Voltage (Ports 1, 2 and 3, ALE, $\overline{\text{PSEN}}$)	$V_{CC} - 0.3$			V	$I_{OH} = -10\ \mu\text{A}$
		$V_{CC} - 0.7$			V	$I_{OH} = -30\ \mu\text{A}$
		$V_{CC} - 1.5$			V	$I_{OH} = -60\ \mu\text{A}$

DC CHARACTERISTICS (Over Operating Conditions) (Continued)

All parameter values apply to all devices unless otherwise indicated.

Symbol	Parameter	Min	Typ (Note 4)	Max	Unit	Test Conditions
V_{OH1}	Output High Voltage (Port 0 in External Bus Mode)	$V_{CC} - 0.3$			V	$I_{OH} = -200 \mu A$
		$V_{CC} - 0.7$			V	$I_{OH} = -3.2 \text{ mA}$
		$V_{CC} - 1.5$			V	$I_{OH} = -7.0 \text{ mA}$
I_{IL}	Logical 0 Input Current (Ports 1, 2 and 3)			-50	μA	$V_{IN} = 0.45V$
I_{LI}	Input leakage Current (Port 0)			± 10	μA	$V_{IN} = V_{IL} \text{ or } V_{IH}$
I_{TL}	Logical 1 to 0 Transition Current (Ports 1, 2 and 3) Commercial Express			-650	μA	$V_{IN} = 2V$
				-750	μA	
RRST	RST Pulldown Resistor	40		225	K Ω	
CIO	Pin Capacitance		10		pF	@ 1 MHz, 25°C

	at 24 MHz		7	13.5	mA	
at 33 MHz (8XC5X-33)		7	15	mA		
Power Down Mode						
8XC5X-33						

NOTES:

1. Capacitive loading on Ports 0 and 2 may cause noise pulses above 0.4V to be superimposed on the V_{OL} s of ALE and Ports 1, 2 and 3. The noise is due to external bus capacitance discharging into the Port 0 and Port 2 pins when these pins change from 1 to 0. In applications where capacitive loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8V. It may be desirable to qualify ALE or other signals with a Schmitt Triggers, or CMOS-level input logic.

2. Capacitive loading on Ports 0 and 2 cause the V_{OH} on ALE and \overline{PSEN} to drop below the 0.9 V_{CC} specification when the address lines are stabilizing.

3. See Figures 6–9 for test conditions. Minimum V_{CC} for Power Down is 2V.

4. Typicals are based on a limited number of samples and are not guaranteed. The values listed are at room temperature and 5V.

5. Under steady state (non-transient) conditions, I_{OL} must be externally limited as follows:

Maximum I_{OL} per port pin: 10mA

Maximum I_{OL} per 8-bit port—

Port 0: 26 mA

Ports 1, 2 and 3: 15 mA

Maximum total I_{OL} for all output pins: 71 mA

If I_{OL} exceeds the test condition, V_{OL} may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

FLOAT WAVEFORMS

PROGRAMMING THE EPROM

The part must be running with a 4 MHz to 6 MHz oscillator. The address of an EPROM location to be programmed is applied to address lines while the code byte to be programmed in that location is applied to data lines. Control and program signals must be held at the levels indicated in Table 4. Normally \overline{EA}/V_{PP} is held at logic high until just before ALE/PROG is to be pulsed. The \overline{EA}/V_{PP} is raised to V_{PP} , ALE/PROG is pulsed low and then \overline{EA}/V_{PP} is returned to a high (also refer to timing diagrams).

NOTES:

- Exceeding the V_{PP} maximum for any amount of time could damage the device permanently. The V_{PP} source must be well regulated and free of glitches.

DEFINITION OF TERMS

ADDRESS LINES: P1.0–P1.7, P2.0–P2.5 respectively for A0–A13.

DATA LINES: P0.0–P0.7 for D0–D7.

CONTROL SIGNALS: RST, \overline{PSEN} , P2.6, P2.7, P3.3, P3.6, P3.7

PROGRAM SIGNALS: ALE/ \overline{PROG} , \overline{EA}/V_{PP}

Table 4. EPROM Programming Modes

Mode	RST	\overline{PSEN}	ALE/ PROG	$\overline{EA}/$ V_{PP}	P2.6	P2.7	P3.3	P3.6	P3.7
Program Code Data	H	L		12.75V	L	H	H	H	H
Verify Code Data	H	L	H	H	L	L	L	H	H
Program Encryption Array Address 0–3FH	H	L		12.75V	L	H	H	L	H
Program Lock Bits	Bit 1	H	L		12.75V	H	H	H	H
	Bit 2	H	L		12.75V	H	H	H	L
	Bit 3	H	L		12.75V	H	L	H	L
Read Signature Byte	H	L	H	H	L	L	L	L	L

Figure 10. Programming the EPROM

PROGRAMMING ALGORITHM

Refer to Table 4 and Figures 10 and 11 for address, data, and control signals set up. To program the 87C5X the following sequence must be exercised.

1. Input the valid address on the address lines.
2. Input the appropriate data byte on the data lines.
3. Activate the correct combination of control signals.
4. Raise \overline{EA}/V_{PP} from V_{CC} to $12.75V \pm 0.25V$.
5. Pulse ALE/\overline{PROG} 5 times for the EPROM array, and 25 times for the encryption table and the lock bits.

Repeat 1 through 5 changing the address and data for the entire array or until the end of the object file is reached.

PROGRAM VERIFY

Program verify may be done after each byte or block of bytes is programmed. In either case a complete verify of the programmed array will ensure reliable programming of the 87C5X.

The lock bits cannot be directly verified. Verification of the lock bits is done by observing that their features are enabled.

Figure 11. Programming Signal's Waveforms

ROM and EPROM Lock System

The program lock system, when programmed, protects the onboard program against software piracy.

The 80C5X has a one-level program lock system and a 64-byte encryption table. See line 2 of Table 5. If program protection is desired, the user submits the encryption table with their code, and both the lock-bit and encryption array are programmed by the factory. The encryption array is not available without the lock bit. For the lock bit to be programmed, the user must submit an encryption table.

The 87C5X has a 3-level program lock system and a 64-byte encryption array. Since this is an EPROM device, all locations are user-programmable. See Table 5.

Encryption Array

Within the EPROM array are 64 bytes of Encryption Array that are initially unprogrammed (all 1's). Every time that a byte is addressed during a verify, 6 address lines are used to select a byte of the Encryption Array. This byte is then exclusive-NOR'ed (XNOR) with the code byte, creating an Encryption Verify byte. The algorithm, with the array in the unprogrammed state (all 1's), will return the code in its original, unmodified form. For programming the Encryption Array, refer to Table 4 (Programming the EPROM).

When using the encryption array, one important factor needs to be considered. If a code byte has the value 0FFH, verifying the byte will produce the encryption byte value. If a large block (>64 bytes) of code is left unprogrammed, a verification routine will display the contents of the encryption array. For this reason all unused code bytes should be programmed with some value other than 0FFH, and not all of them the same value. This will ensure maximum program protection.

Program Lock Bits

The 87C5X has 3 programmable lock bits that when programmed according to Table 5 will provide different levels of protection for the on-chip code and data.

Erasing the EPROM also erases the encryption array and the program lock bits, returning the part to full functionality.

Reading the Signature Bytes

The 8XC5X has 3 signature bytes in locations 30H, 31H, and 60H. To read these bytes follow the procedure for EPROM verify, but activate the control lines provided in Table 4 for Read Signature Byte.

Location	Device	Contents
30H	All	89H
31H	All	58H
60H	80C52	12H
	87C52	52H
	80C54	14H
	87C54	54H
	80C58	18H
	87C58	58H

Erasure Characteristics (Windowed Packages Only)

Erasure of the EPROM begins to occur when the chip is exposed to light with wavelength shorter than approximately 4,000 Angstroms. Since sunlight and fluorescent lighting have wavelengths in this range, exposure to these light sources over an extended time (about 1 week in sunlight, or 3 years in room-level fluorescent lighting) could cause inadvertent erasure. If an application subjects the device to this type of exposure, it is suggested that an opaque label be placed over the window.

The recommended erasure procedure is exposure to ultraviolet light (at 2537 Angstroms) to an integrated dose of at least 15 W-sec/cm². Exposing the EPROM to an ultraviolet lamp of 12,000 μW/cm² rating for 30 minutes, at a distance of about 1 inch, should be sufficient.

Erasure leaves all the EPROM Cells in a 1's state.

Table 5. Program Lock Bits and the Features

Program Lock Bits				Protection Type
	LB1	LB2	LB3	
1	U	U	U	No Program Lock features enabled. (Code verify will still be encrypted by the Encryption Array if programmed.)
2	P	U	U	MOVC instructions executed from external program memory are disabled from fetching code bytes from internal memory, EA is sampled and latched on Reset, and further programming of the EPROM is disabled.
3	P	P	U	Same as 2, also verify is disabled.
4	P	P	P	Same as 3, also external execution is disabled.

NOTE:

Any other combination of the lock bits is not defined.

EPROM PROGRAMMING AND VERIFICATION CHARACTERISTICS

($T_A = 21^\circ\text{C}$ to 27°C ; $V_{CC} = 5\text{V} \pm 20\%$; $V_{SS} = 0\text{V}$)

Symbol	Parameter	Min	Max	Units
V_{PP}	Programming Supply Voltage	12.5	13.0	V
I_{PP}	Programming Supply Current		75	mA
1/TCLCL	Oscillator Frequency	4	6	MHz
TAVGL	Address Setup to $\overline{\text{PROG}}$ Low	48TCLCL		
TGHAX	Address Hold after $\overline{\text{PROG}}$	48TCLCL		
TDVGL	Data Setup to $\overline{\text{PROG}}$ Low	48TCLCL		
TGHDX	Data Hold after $\overline{\text{PROG}}$	48TCLCL		
TEHSH	(Enable) High to V_{PP}	48TCLCL		
TSHGL	V_{PP} Setup to $\overline{\text{PROG}}$ Low	10		μs
TGHSL	V_{PP} Hold after $\overline{\text{PROG}}$	10		μs
TGLGH	$\overline{\text{PROG}}$ Width	90	110	μs
TAVQV	Address to Data Valid		48TCLCL	
TELQV	ENABLE Low to Data Valid		48TCLCL	
TEHQZ	Data Float after ENABLE	0	48TCLCL	
TGHGL	$\overline{\text{PROG}}$ High to $\overline{\text{PROG}}$ Low	10		μs

EPROM PROGRAMMING AND VERIFICATION WAVEFORMS

Thermal Impedance

All thermal impedance data is approximate for static air conditions at 1W of power dissipation. Values will change depending on operating conditions and applications. See the Intel Packaging Handbook (Order Number 240800) for a description of Intel's thermal impedance test methodology.

Package	θ_{JA}	θ_{JC}	Device
P	45°C/W	16°C/W	All
D	45°C/W	15°C/W	All
N	46°C/W	16°C/W	All
S	87°C/W	18°C/W	52
	96°C/W	24°C/W	54
	90°C/W	22°C/W	58

DATA SHEET REVISION HISTORY

Data sheets are changed as new device information becomes available. Verify with your local Intel sales office that you have the latest version before finalizing a design or ordering devices.

The following differences exist between this data-sheet (272336-003) and the previous version (272336-002):

1. Removed 8XC5X-3 and 8XC5X-20 from the data sheet.
2. Included 8XC5X-24 and 8XC5X-33 devices.
3. Removed the statement "The 80C32 standard, -1 and -2, and 80C52 standard, -1 and -2, do not have the . . ." from the section DESIGN CONSIDERATION.

The following differences exist between this data-sheet (272336-002) and the previous version (272336-001):

1. Removed 8XC5X-L from the data sheet.
2. Included features not available in 80C32-Standard, -1 and -2, and 80C52-Standard, -1 and -2 devices.

This 8XC5X datasheet (272336-001) replaces the following datasheets:

87C52/80C52/80C32	270757-003
87C52/80C52/80C32 EXPRESS	270868-002
