AM26LS30

Dual differential RS-422 party line/quad single-ended RS-423 line driver

DESCRIPTION

The AM26LS30 is a line driver designed for digital data transmission. A mode control input provides a choice of operation either as two differential line drivers which meet all the requirements of EIA Standard RS-422 or as four independent single-ended RS-423 line drivers.

In the differential mode, the outputs have individual 3-State controls. In the high impedance state, these outputs will not clamp the line over a common mode transmission line voltage of $\pm 10V$. A typical full duplex system consists of the AM26LS30 differential line driver and up to twelve AM26LS32 line receivers, or the AM26LS32 line receiver and up to thirty-two AM26LS30 differential drivers.

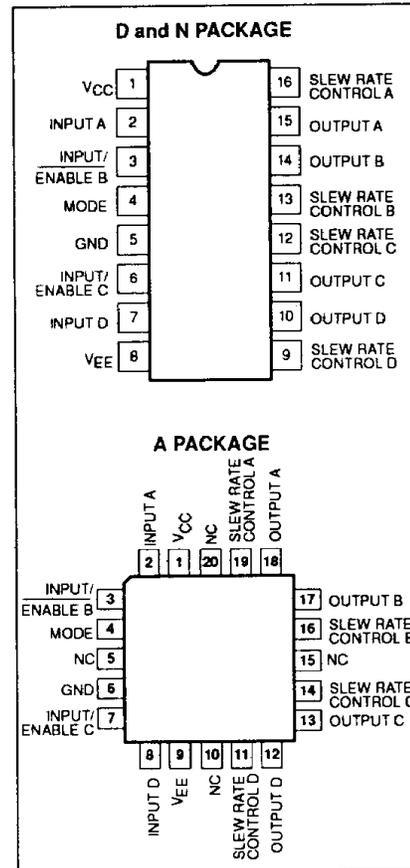

A slew control pin allows the use of an external capacitor to control slew rate for suppression of near-end cross-talk to receivers in the cable.

The AM26LS30 is constructed using high speed oxide isolated bipolar processing.

FEATURES

- Dual RS-422 line driver or quad RS-423 line driver
- Driver outputs do not clamp line with power off or in high impedance state
- Individual 3-State controls when used in differential mode
- Low I_{CC} and I_{EE} power consumption
- RS-422 differential mode: 35mW/driver typ
- RS-423 single-ended mode: 26mW/driver typ
- Individual slew rate control for each output
- 50 Ω transmission line drive capability (RS-422 into virtual ground)
- Low current PNP inputs compatible with TTL, MOS and CMOS
- High capacitive load drive capability
- Exact replacement for DS16/3691
- High speed oxide isolated bipolar processing
