

# PRECISION32<sup>™</sup> SOFTWARE DEVELOPMENT KIT CODE EXAMPLES OVERVIEW

### 1. Introduction

The Precision32<sup>™</sup> code examples are part of the Software Development Kit (SDK) installed with the Precision32 software package available at www.silabs.com/32bit-software. The code examples are simple and complete examples that illustrate and highlight the peripheral modes and features. They are also modular so code can be copied into an application base, making peripheral-specific code development easy.

Figure 1 shows the Precision32 firmware layer block diagram.

#### Figure 1. Firmware Layer Block Diagram

### 2. Relevant Documentation

Precision32 Application Notes are listed on the following website: www.silabs.com/32bit-mcu.

- AN664: Precision32<sup>™</sup> CMSIS and HAL User's Guide
- AN667: Getting Started with the Silicon Labs Precision32<sup>™</sup> IDE
- AN670: Getting Started with the Silicon Labs Precision32<sup>™</sup> AppBuilder
- AN673: Precision32<sup>™</sup> Software Development Kit (SDK) Overview

### 3. Code Example Organization

The code examples are separated by device and are located in **si32-x.y\Examples\device**, where **x** is the major SDK version, and **y** is the minor SDK version. Each code example has its own folder named with the peripheral or example name.

The IDE can import these code examples using the instructions in the application note, "AN667: Getting Started with the Silicon Labs Precision32 IDE". Sub-directories under the example folder include example projects for uVision and IAR.

Figure 2 displays the code example organization on disk.

### 4. Detailed Documentation

The detailed documentation for each code example is in the Readme file in the example folders. This file includes a basic description of the example, the resources and clock speeds used, notes on the example and supported modes, and detailed how-to-use steps.

The **Blinky\_Readme.txt** file shown in Figure 3 is installed in **si32-x.y\Example\sim3u1xx\Blinky** for SiM3U1xx devices after installing the Precision32 software package.

Figure 3. Code Example Documentation

## 5. SiM3U1xx Blinky Example

Blinky uses the SiM3U1xx RTC0 module and SysTick to toggle two LEDs. PB2.10 (LED on the SiM3U1xx MCU card) toggles every 500 ms using the RTC counting 10 ms intervals. PB2.11 (also an LED) toggles every second using SysTick. The example also reads the switches on the MCU card (PB2.8 and PB2.9) every 500 ms and prints their status to the **Console** view (semi-hosting) by default.

The code examples follow the Silicon Labs AppBuilder file generation structure: generated files are included in the **src\generated** folder with the **g-** prefix, and application files are in the **src** folder with **my-** prefix. All of the modes implemented in the example are called from **main**. In the Blinky example, **main** calls **gModes\_enter\_my\_default\_mode()** from **gModes.c**, which then calls **gCpu\_enter\_default\_config()** in **gCpu.c**, and so forth.

These code examples use the Silicon Labs Hardware Access Layer (HAL) macros by default.

Figure 4. Blinky Example

### 5.1. Blinky Application-Specific Files

#### 5.1.1. main.c

The **main.c** file calls functions from the **gModes.c** and the port HAL as shown in Figure 5. This file also includes all the main application code that sits in a while(1) loop, toggling the LED pins or reading the switches and printing their status to the **Console** view.

Figure 5. main.c Dependencies

#### 5.1.2. myCpu.c

This file has the application-specific implementation of **mySystemInit()** called by **system\_sim3u1xx.c** in the HAL. For Blinky, this function:

- Disables the Watchdog Timer.
- Enables APB to the Port Bank modules.
- Sets the Serial Wire Viewer pin (PB1.3) to push-pull.

Figure 6 shows the dependencies for myCpu.c.

#### Figure 6. myCpu.c Dependencies

#### 5.1.3. myPB.c

This file doesn't include any application-specific code for the Blinky example.

#### 5.1.4. myRtc0.c

The **myRtc0.c** file includes the second-level handlers for the RTC0 Alarm 0 and RTC0 oscillator fail interrupts. These second-level handlers are called from the first-level handlers in gRtc0.c.

The second-level Alarm 0 handler:

- Reads the RTC0 counter value.
- Sets the RTC0 Alarm 0 value with a new value equal to the current counter value + 10 ms.
- Increments **msTicks\_10**, which keeps track of the 10 ms intervals.
- Clears the Alarm 0 interrupt in the RTC0 module.

The second-level oscillator fail handler sits in a while(1) loop to indicate an unrecoverable error condition.

Figure 6 shows the dependencies for myRtc0.c.

Figure 7. myRtc0.c Dependencies

#### 5.2. Blinky AppBuilder-Generated Files

#### 5.2.1. gCpu.c

This file contains the SysTick handler, which increments the **msTicks** variable, and the **gCpu\_enter\_default\_config()** function, which is called from **gModes\_enter\_my\_default\_mode()** in **gModes.c**. This function sets the **SystemCoreClock** variable to 20 MHz, since Blinky uses the Low Power Oscillator, and sets the SysTick timer to trigger every millisecond.

Figure 8 shows the dependencies for **gCpu.c**.

Figure 8. gCpu.c Dependencies

#### 5.2.2. gModes.c

The gModes.c file has two functions: gModes\_enter\_my\_default\_mode() and gModes\_enter\_my\_off\_mode().

The default mode function places the device in the default mode after a reset and calls gCpu\_enter\_default\_config() from gCpu.c, gPB\_enter\_default\_config() from gPB.c, and gRtc0\_enter\_default\_config() from gRtc0.c.

The off mode function is not currently called from anywhere in the project and includes calls to gRtc0\_enter\_off\_config() from gRtc0.c and gPB\_enter\_off\_config() from gPB.c.

Figure 9 illustrates the dependencies diagram for **gModes.c**.

Figure 9. gModes.c Dependencies

#### 5.2.3. gPB.c

This file includes two functions: gPB\_enter\_off\_config() and gPB\_enter\_default\_config().

The **gPB\_enter\_off\_config()** function is called by **gModes\_enter\_my\_off\_mode()** in **gModes.c** and sets all the pins to digital input mode, disables crossbar 1, and disables the APB clock to the port registers.

The gPB\_enter\_default\_config() function:

- Enables the APB clock to the port registers.
- Sets the SWV pin to push-pull.
- Enables crossbar 1.
- Sets the PB2.10 and PB2.11 pins to push-pull.
- Sets the PB2.8 and PB2.9 pins to digital input mode.
- Configures the PB0.9 and PB0.10 RTC0 oscillator input pins as analog inputs.
- Configures PB2.7 to output the RTC0 clock by setting PB2.7 to push-pull, skipping the PB2.0-PB2.6 pins on crossbar 1, and enabling the oscillator output on crossbar 1.

Figure 10 shows the dependencies for **gPB.c**.

| Blinky |                       |  |  |  |
|--------|-----------------------|--|--|--|
| gPB.c  |                       |  |  |  |
|        |                       |  |  |  |
|        | si32Hal               |  |  |  |
| -      | SI32_CLKCTRL_A_Type.c |  |  |  |
| -      | SI32_PBSTD_A_Type.c   |  |  |  |
| L      | SI32_PBCFG_A_Type.c   |  |  |  |

Figure 10. gPB.c Dependencies

#### 5.2.4. gRtc0.c

The **gRtc0.c** file includes the first-level interrupt handlers for the RTC0 oscillator fail (**RTC0FAIL\_IRQHandler()**) and Alarm 0 (**RTC0ALRM\_IRQHandler()**). These first-level interrupt handlers just call the second-level handlers and must use the handler names defined in **sim3u1xx.h**, the device-specific header file.

In addition to the first-level interrupt handlers, gRtc0.c has two functions: gRtc\_enter\_off\_config() and gRtc0\_enter\_default\_config().

The **gRtc\_enter\_off\_config()** function disables the Alarm 0 interrupt in the RTC0 module, clears any pending oscillator fail or Alarm 0 interrupts in the NVIC, and disables these two interrupts in the NVIC. In addition, the function stops the RTC0 timer, disables the RTC0 module, and disables the APB clock to RTC0.

The gRtc0\_enter\_default\_config() function:

- Enables the APB clock to the RTC0 module.
- Enables the RTC module and configures it for crystal oscillator mode.
- Sets the initial Alarm 0 value for 10 ms.
- Clears any pending interrupts and enables the interrupts in the NVIC.
- Enables the Alarm 0 interrupt in the RTC0 module.
- Enables the RTC0 output.

Figure 11 shows the dependencies for **gRtc0.c**.

Figure 11. gRtc0.c Dependencies
