

**500mA LOW NOISE LDO REGULATOR****AP2213****General Description**

The AP2213 is a 500mA output current fixed voltage regulator which provides low noise, very low dropout voltage (typically 350mV at 500mA), very low standby current (1 μ A maximum) and excellent power supply ripple rejection (PSRR 75dB at 100Hz) in battery powered applications, such as handsets and PDAs and in noise sensitive applications, such as RF electronics.

The AP2213 features individual logic compatible enable/shutdown control inputs, a low power shutdown mode for extended battery life, over current protection, over temperature protection, as well as reversed-battery protection.

The AP2213 has 2.5V, 3.0V and 3.3V versions.

The AP2213 is available in TO-252-2 (1) and SOIC-8 packages.

Features

- Up to 500mA Output Current
- Low Standby Current
- Low Dropout Voltage: $V_{DROP}=350mV$ at 500mA
- High Output Accuracy: $\pm 1\%$
- Good Ripple Rejection Ability: 75dB at 100Hz and $I_{OUT}=100\mu A$
- Tight Load and Line Regulation
- Low Temperature Coefficient
- Over Current Protection
- Thermal Protection
- Reversed-battery Protection
- Logic-controlled Enable

Applications

- Laptop, Notebook, and Palmtop Computer
- CD-ROM, CD-R/RW, DVD Driver
- Portable Electronic
- PC Peripheral

BCD Semiconductor's Pb-free products, as designated with "E1" suffix in the part number, are RoHS compliant.

**500mA LOW NOISE LDO REGULATOR****AP2213****Absolute Maximum Ratings (Note 1)**

Parameter	Symbol	Value	Unit	
Supply Input Voltage	V_{IN}	20	V	
Enable Input Voltage	V_{EN}	20	V	
Power Dissipation	P_D	Internally Limited (Thermal Protection)	W	
Lead Temperature (Soldering, 10sec)	T_{LEAD}	260	°C	
Junction Temperature	T_J	150	°C	
Storage Temperature	T_{STG}	-65 to 150	°C	
ESD (Machine Model)	ESD	300	V	
Thermal Resistance (No Heatsink)	θ_{JA}	TO-252-2 (1)	90	°C/W
		SOIC-8	160	

Note 1: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "Recommended Operating Conditions" is not implied. Exposure to "Absolute Maximum Ratings" for extended periods may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Min	Max	Unit
Supply Input Voltage	V_{IN}	2.5	18	V
Enable Input Voltage	V_{EN}	0	18	V
Operating Junction Temperature	T_J	-40	125	°C

Figure 20. ESR vs. Output Current

500mA LOW NOISE LDO REGULATOR

AP2213

Typical Application

Figure 21. Typical Application of AP2213 (Note 7)

Note 7: Dropout voltage is 350mV when $T_A=25^{\circ}\text{C}$. In order to obtain a normal output voltage, $V_{\text{OUT}}+0.35\text{V}$ is the minimum input voltage which will results a low PSRR, imposing a bad influence on system. Therefore, the recommended input voltage is $V_{\text{OUT}}+1\text{V}$ to 18V. For AP2213-2.5 version, its input voltage can be set from 3.5V($V_{\text{OUT}}+1\text{V}$) to 18V.

**500mA LOW NOISE LDO REGULATOR****AP2213****Application Information****Input Capacitor**

A 1 μ F minimum capacitor is recommended to be placed between V_{IN} and GND.

Output Capacitor

It is required to prevent oscillation. 1 μ F minimum is recommended when C_{BYP} is unused. 2.2 μ F minimum is recommended when C_{BYP} is 100pF. The output capacitor may be increased to improve transient response.

Noise Bypass Capacitor

Bypass capacitor is connected to the internal voltage reference. A 100pF capacitor connected from BYP to GND make this reference quiet, resulting in a significant reduction in output noise, but the ESR stable area will be narrowed.

The start-up speed of the AP2213 is inversely proportional to the value of reference bypass capacitor. In some cases, if output noise is not a major concern and rapid turn-on is necessary, omit C_{BYP} and leave BYP open.

Power Dissipation

Thermal shutdown may take place if exceeding the maximum power dissipation in application. Under all possible operating conditions, the junction temperature must be within the range specified under absolute maximum ratings to avoid thermal shutdown.

To determine if the power dissipated in the regulator reaches the maximum power dissipation (see figure 16, 17), using:

$$T_J = P_D * \theta_{JA} + T_A$$

$$P_D = (V_{IN} - V_{OUT}) * I_{OUT} + V_{IN} * I_{GND}$$

Where: $T_J \leq T_{J(max)}$. $T_{J(max)}$ is absolute maximum ratings for the junction temperature; $V_{IN} * I_{GND}$ can be ignored due to its small value.

$T_{J(max)}$ is 150 $^{\circ}$ C, θ_{JA} is 90 $^{\circ}$ C/W for TO-252-2 (1) package and 160 $^{\circ}$ C/W for SOIC-8 package.

Example: For 2.5V version packaged in SOIC-8, $I_{OUT} = 500\text{mA}$, $T_A = 50^{\circ}\text{C}$, $V_{IN(Max)}$ is:
 $(150^{\circ}\text{C} - 50^{\circ}\text{C}) / (0.5\text{A} * 160^{\circ}\text{C/W}) + 2.5\text{V} = 3.75\text{V}$

Therefore, for good performance, please make sure that input voltage is less than 3.75V without heatsink when $T_A = 50^{\circ}\text{C}$.
