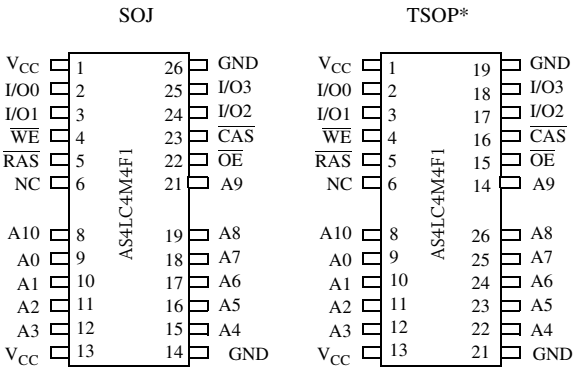
4M×4 CMOS DRAM (Fast Page) 3.3V Family

Features

- Organization: 4,194,304 words × 4 bits
- High speed
  - 50/60 ns $\overline{RAS}$ access time
  - 25/30 ns column address access time
  - 12/15 ns $\overline{CAS}$ access time
- Low power consumption
  - Active: 500 mW max
  - Standby: 3.6 mW max, CMOS I/O
- Fast page mode
- Refresh
  - 2048 refresh cycles, 32 ms refresh interval
  - $\overline{RAS}$-only or $\overline{CAS}$-before-$\overline{RAS}$ refresh or self-refresh
- TTL-compatible, three-state I/O
- JEDEC standard package
  - 300 mil, 24/26-pin SOJ
- 3.3V power supply
- Latch-up current ≥ 200 mA
- ESD protection ≥ 2000 volts
- Industrial and commercial temperature available

Pin arrangement



*TSOP availability to be determined

Pin designation

Pin(s)	Description
A0 to A10	Address inputs
$\overline{RAS}$	Row address strobe
$\overline{CAS}$	Column address strobe
$\overline{WE}$	Write enable
I/O0 to I/O3	Input/output
$\overline{OE}$	Output enable
V_{CC}	Power
GND	Ground

Functional description

The AS4LC4M4F1 is a high performance 16-megabit CMOS Dynamic Random Access Memory (DRAM) device organized as 4,194,304 words × 4 bits. The device is fabricated using advanced CMOS technology and innovative design techniques resulting in high speed, extremely low power and wide operating margins at component and system levels. The Alliance 16Mb DRAM family is optimized for use as main memory in PC, workstation, router and switch applications.

This device features a high speed page-mode operation where read and write operations within a single row (or page) can be executed at very high speed by toggling column addresses within that row. Row and column addresses are alternately latched into input buffers using the falling edge of $\overline{RAS}$ and $\overline{CAS}$ inputs respectively. Also, $\overline{RAS}$ is used to make the column address latch transparent, enabling application of column addresses prior to $\overline{CAS}$ assertion.

Refresh on the 2048 address combinations of A0 to A10 must be performed every 32 ms using:

- $\overline{RAS}$-only refresh: $\overline{RAS}$ is asserted while $\overline{CAS}$ is held high. Each of the 2048 rows must be strobed. Outputs remain high impedence.
- Hidden refresh: $\overline{CAS}$ is held low while $\overline{RAS}$ is toggled. Refresh address is generated internally. Outputs remain low impedence with previous valid data.
- $\overline{CAS}$-before-$\overline{RAS}$ refresh (CBR): $\overline{CAS}$ is asserted prior to $\overline{RAS}$. Refresh address is generated internally. Outputs are high-impedence ($\overline{OE}$ and $\overline{WE}$ are don't care).
- Normal read or write cycles refresh the row being accessed.
- Self-refresh cycles

The AS4LC4M4F1 is available in the standard 24/26-pin plastic SOJ. TSOP 24/26-pin availability is to be determined. The AS4LC4M4F1 operates with a single power supply of 3.3V ± 0.3V and provides TTL compatible inputs and outputs.

Notes

1 I_{CC1}, I_{CC3}, I_{CC4}, and I_{CC6} are dependent on frequency.

2 I_{CC1} and I_{CC4} depend on output loading. Specified values are obtained with the output open.

3 An initial pause of 200 µs is required after power-up followed by any 8 $\overline{RAS}$ cycles before proper device operation is achieved. In the case of an internal refresh counter, a minimum of 8 $\overline{CAS}$-before-$\overline{RAS}$ initialization cycles instead of 8 $\overline{RAS}$ cycles are required. 8 initialization cycles are required after extended periods of bias without clocks (greater than 8 ms).

4 AC Characteristics assume t_T = 2 ns. All AC parameters are measured with a load equivalent to two TTL loads and 100 pF, V_{IL} (min) $\geq$ GND and V_{IH} (max) $\leq V_{CC}$.

5 V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL}.

6 Operation within the t_{RCD} (max) limit insures that t_{RAC} (max) can be met. t_{RCD} (max) is specified as a reference point only. If t_{RCD} is greater than the specified t_{RCD} (max) limit, then access time is controlled exclusively by t_{CAC}.

7 Operation within the t_{RAD} (max) limit insures that t_{RAC} (max) can be met. t_{RAD} (max) is specified as a reference point only. If t_{RAD} is greater than the specified t_{RAD} (max) limit, then access time is controlled exclusively by t_{AA}.

8 Assumes three state test load (5 pF and a 380 Ω Thevenin equivalent).

9 Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.

10 t_{OFF} (max) defines the time at which the output achieves the open circuit condition; it is not referenced to output voltage levels. t_{OFF} is referenced from rising edge of $\overline{RAS}$ or $\overline{CAS}$, whichever occurs last.

11 t_{WCS}, t_{WCH}, t_{RWD}, t_{CWD} and t_{AWD} are not restrictive operating parameters. They are included in the datasheet as electrical characteristics only. If $t_{WS} \geq t_{WS}$ (min) and $t_{WH} \geq t_{WH}$ (min), the cycle is an early write cycle and data out pins will remain open circuit, high impedance, throughout the cycle. If $t_{RWD} \geq t_{RWD}$ (min), $t_{CWD} \geq t_{CWD}$ (min) and $t_{AWD} \geq t_{AWD}$ (min), the cycle is a read-write cycle and the data out will contain data read from the selected cell. If neither of the above conditions is satisfied, the condition of the data out at access time is indeterminate.

12 These parameters are referenced to $\overline{CAS}$ leading edge in early write cycles and to $\overline{WE}$ leading edge in read-write cycles.

13 Access time is determined by the longest of t_{CAA} or t_{CAC} or t_{CPA}

14 $t_{ASC} \geq t_{CP}$ to achieve t_{PC} (min) and t_{CPA} (max) values.

15 These parameters are sampled and not 100% tested.

AC test conditions

- Access times are measured with output reference levels of
  V_{OH} = 2.4V and V_{OL} = 0.4V,
  V_{IH} = 2.0V and V_{IL} = 0.8V
- Input rise and fall times: 2 ns
