32-Pin DIP, 32-Pin SOJ  
& 32-Pin TSOP

### GENERAL DESCRIPTION

The AS5C4009 is organized as 524,288 x 8 SRAM utilizing a special ultra low power design process. Micross' pinout adheres to the JEDEC standard for pinout on 4 megabit SRAMs. The evolutionary 32 pin version allows for easy upgrades from the 1 meg SRAM design.

For flexibility in memory applications, Micross offers chip enable (CE\ ) and output enable (OE\ ) capabilities. These features can place the outputs in High-Z for additional flexibility in system design.

This devices operates from a single +5V power supply and all inputs and outputs are fully TTL-compatible.

Writing to these devices is accomplished when write enable (WE\ ) and CE\ inputs are both LOW. Reading is accomplished when WE\ remains HIGH and CE\ and OE\ go LOW. The device offers a reduced power standby mode when disabled, by lowering VCC to 2V and maintaining CE\ = 2V. This allows system designers to meet ultra low standby power requirements.

1. tHZ and tOHZ are defined as the time at which the outputs achieve the open circuit conditions and are not referenced to output voltage levels.
  2. At any given temperature and voltage condition, tHZ (MAX) is less than tLZ (MIN) both for a given device and from device to device interconnection.
  3. A write occurs during the overlap of a low CE\ and a low WE\. A write begins at the latest transition among CE\ going Low and WE\ going Low; A write ends at the earliest transition among CE\ going High and WE\ going High; tWP is measured from the beginning of write to the end of write.
  4. tCW is measured from the CE\ going Low to end of write.
  5. tAS is measured from the address valid to the beginning of write.
  6. tWR is measured from the end of write to the address change. tWR applied in case a write ends as CE\ or WE\ going High.
