## ECL/PECL Differential Receiver

### FEATURES

- 250ps Propagation Delay
- High Bandwidth Output Transitions
- 75k $\Omega$  Internal Input Pulldown Resistors
- Direct Replacement for ON Semiconductor MC10EL16 & MC100EL16

### DESCRIPTION

The AZ10/100EL16 is a differential receiver. The device is functionally equivalent to the E116 device with higher performance capabilities. With output transition times significantly faster than the E116, the EL16 is ideally suited for interfacing with high frequency sources.

The EL16 provides a  $V_{BB}$  output for either single-ended use or a DC bias reference for AC coupling to the device. For single-ended input applications, the  $V_{BB}$  reference should be connected to one side of the  $D/\bar{D}$  differential input pair. The input signal is then fed to the other  $D/\bar{D}$  input. The  $V_{BB}$  pin can support 1.0mA sink/source current. When used, the  $V_{BB}$  pin should be bypassed to ground via a 0.01 $\mu$ F capacitor.

Under open input conditions (pulled to  $V_{EE}$ ) internal input clamps will force the Q output LOW.

NOTE: Specifications in the ECL/PECL tables are valid when thermal equilibrium is established.

### PIN DESCRIPTION

PIN	FUNCTION
D, $\bar{D}$	Data Inputs
Q, $\bar{Q}$	Data Outputs
$V_{BB}$	Reference Voltage Output
$V_{CC}$	Positive Supply
$V_{EE}$	Negative Supply
NC	No Connect

- Duty cycle skew is the difference between a  $t_{PLH}$  and  $t_{PHL}$  propagation delay through a device.
- $V_{PP}$  is the minimum peak-to-peak differential input swing for which AC parameters are guaranteed. The device has a DC gain of  $\approx 40$ .
- The  $V_{CMR}$  range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between  $V_{PP}(\text{min})$  and 1V.
