

# 5-channel BTL driver for CD players

## BA6796FP

The BA6796FP, an IC designed for CD and MD players, has a 5-channel BTL power driver and a standard operational amplifier. The spindle and tray driver share a single output buffer, and are specified with a control pin. In addition, the internal level shift circuit reduces the number of attached components.

### ●Applications

CD players, CD-ROM drives, MD players and other optical disc devices

### ●Features

- 1) 5-channel BTL driver in a 28-pin HSOP package, allowing for application miniaturization.
- 2) The five drivers are turned on and off according to control pin logic combinations.
- 3) The tray driver operates even when the servo power supply drops.
- 4) Internal thermal shutdown circuit.
- 5) Gain is adjustable with an attached resistor.
- 6) Internal standard operational amplifier.

### ●Absolute maximum ratings (Ta = 25°C)

Parameter	Symbol	Limits	Unit
Power supply voltage	V <sub>CC</sub>	18	V
Power dissipation	P <sub>d</sub>	1.7*	W
Operating temperature	T <sub>opr</sub>	-35~+85	°C
Storage temperature	T <sub>stg</sub>	-55~+150	°C

\* When mounted on a 50 × 50 × 1 mm paper phenol board  
Reduced by 13.6 mW for each increase in Ta of 1°C over 25°C.

### ●Recommended operating conditions (Ta = 25°C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Power supply voltage	V <sub>CC</sub>	4.8	—	12	V

● Operation notes

(1) Setting the tray motor driver voltage (forward mode)

Fig. 3

Note: The tray driver output voltage will not exceed the power supply's maximum output voltage, even if set above this maximum voltage (refer to the following page). The example above applies only when setting below the maximum output voltage. Maximum output voltage for the power supply can be output by pulling up the tray input pin (pin 8), or by connecting it to Vcc.

(2) Mute functions

Mute function	Muted channels
Thermal shutdown	All channels
Muting during supply voltage drop	All channels
Muting during bias voltage drop	CH1-CH4

«Thermal shutdown»

The output current is muted when the chip temperature exceeds 175°C (typically).

«Supply voltage drop muting»

The internal circuits turn off when the supply voltage drops below 4.3V (typically), and turn on again when it rises above 4.5V (typically).

«Bias drop muting»

Muting also occurs when the bias pin voltage (26 pin) is lowered below 1.4V (typically). Be sure the voltage stays between 1.6V and 6.5V during normal operation.

(3) Muting occurs during thermal shutdown and when the supply voltage or bias pin voltage drops. In each case, only the driver is muted. The output pin voltage during muting is the internal bias voltage, roughly  $V_{CC} - V_F / 2$ .

(4) Attach a 0.1μF bypass capacitor to the power supply, at the base of the IC.

(5) Connect the radiating fin to an external ground.
