

Very Low Power/Voltage CMOS SRAM 256K X 8 bit

BS62LV2000

FEATURES

- Wide Vcc operation voltage : 2.7V ~ 5.5V
- Very low power consumption :
 - Vcc = 3.0V C-grade : 20mA (Max.) operating current
I-grade : 25mA (Max.) operating current
0.15uA (Typ.) CMOS standby current
 - Vcc = 5.0V C-grade : 40mA (Max.) operating current
I-grade : 45mA (Max.) operating current
3uA (Typ.) CMOS standby current
- High speed access time :
 - 70 70ns(Max.) at Vcc = 3.0V
 - 10 100ns(Max.) at Vcc = 3.0V
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with CE2, CE1, and OE options
- All I/O pins are 3V/5V tolerant

DESCRIPTION

The BS62LV2000 is a high performance, very low power CMOS Static Random Access Memory organized as 262,144 words by 8 bits and operates from a wide range of 2.7V to 5.5V supply voltage. Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 0.15uA and maximum access time of 70ns in 3V operation. Easy memory expansion is provided by an active LOW chip enable (CE1), an active HIGH chip enable (CE2), and active LOW output enable (OE) and three-state output drivers. The BS62LV2000 has an automatic power down feature, reducing the power consumption significantly when chip is deselected. The BS62LV2000 is available in the JEDEC standard 32 pin 450mil Plastic SOP, 8mmx13.4mm STSOP and 8mmx20mm TSOP.

■ PIN DESCRIPTIONS

Name	Function
A0-A17 Address Input	These 18 address inputs select one of the 262,144 x 8-bit words in the RAM
$\overline{CE1}$ Chip Enable 1 Input CE2 Chip Enable 2 Input	$\overline{CE1}$ is active LOW and CE2 is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected.
\overline{WE} Write Enable Input	The write enable input is active LOW and controls read and write operations. With the chip selected, when \overline{WE} is HIGH and \overline{OE} is LOW, output data will be present on the DQ pins; when \overline{WE} is LOW, the data present on the DQ pins will be written into the selected memory location.
\overline{OE} Output Enable Input	The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when \overline{OE} is inactive.
DQ0-DQ7 Data Input/Output Ports	These 8 bi-directional ports are used to read data from or write data into the RAM.

READ CYCLE1 (1,2,4)

READ CYCLE2 (1,3,4)

READ CYCLE3 (1,4)

NOTES:

1. \overline{WE} is high in read Cycle.
2. Device is continuously selected when $\overline{CE1} = V_{IL}$ and $CE2 = V_{IH}$.
3. Address valid prior to or coincident with $\overline{CE1}$ transition low and/or $CE2$ transition high.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 500mV$ from steady state with $C_L = 5pF$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.

■ SWITCHING WAVEFORMS (WRITE CYCLE)
WRITE CYCLE1⁽¹⁾

WRITE CYCLE2 (1,6)

NOTES:

1. WE must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of $\overline{CE1}$ and CE2 active and \overline{WE} low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{WR} is measured from the earlier of $\overline{CE1}$ or \overline{WE} going high or CE2 going low at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the $\overline{CE1}$ low transition or the CE2 high transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
6. \overline{OE} is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If $\overline{CE1}$ is low and CE2 is high during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm 500\text{mV}$ from steady state with $C_L = 5\text{pF}$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. t_{CW} is measured from the later of $\overline{CE1}$ going low or CE2 going high to the end of write.
