OVERVIEW

The SM5010 series are crystal oscillator module ICs. They incorporate oscillator and output buffer circuits, employing built-in oscillator capacitors and feedback resistors with excellent frequency response, eliminating the need for external components to form a stable crystal oscillator. There are 7 oscillator configurations available for design and application optimization.

FUNCTIONAL DESCRIPTION

Standby Function

5010AH×, AK×, AN×, BH×, BK×, BN×, DN×, FN×, FH×, HN×, HK× series

When INHN goes LOW, the output on Q becomes high impedance, but internally the oscillator does not stop.

5010CL× series

When INHN goes LOW, the oscillator stops and the oscillator output on Q becomes high impedance.

5010EA× series

When INHN goes LOW, the oscillator stops and the oscillator output on Q becomes LOW.

Version	INHN	Q	Oscillator
AH×, AK×, AN×, BH×, BK×, BN×, DN×, FH×, FH×, HN×, HK× series	HIGH (or open)	Any f_O, $f_O/2$, $f_O/4$, $f_O/8$ or $f_O/16$ output frequency	Normal operation
	LOW	High impedance	Normal operation
CL× series	HIGH (or open)	Any f_O, $f_O/2$, $f_O/4$, $f_O/8$ or $f_O/16$ output frequency	Normal operation
	LOW	High impedance	Stopped
EA× series	HIGH (or open)	Either f_O or $f_O/2$ output frequency	Normal operation
	LOW	LOW	Stopped

Power-saving Pull-up Resistor (CL series only)

The INHN pull-up resistance changes in response to the input level (HIGH or LOW). When INHN goes LOW (standby state), the pull-up resistance becomes large to reduce the current consumption during standby.
