

GaAs MMIC

Preliminary Data

- Broadband Power Amplifier [800..3500 Mhz]
- DECT, PHS, PCS, GSM, AMPS, WLAN, WLL
- Single Voltage Supply
- Operating voltage range: 2.0 to 6 V
- Pout = 25.5dBm at Vd=2.4V
- Pout = 27.0dBm at Vd=3.0V
- Pout = 30.0dBm at Vd=5.0V
- Overall power added efficiency up to 50 %
- Easy external matching

ESD: **E**lectrostatic **d**ischarge sensitive device, observe handling precautions!

Type	Marking	Ordering code (taped)	Package
CGY 196	t.b.d.	t.b.d.	SCT598

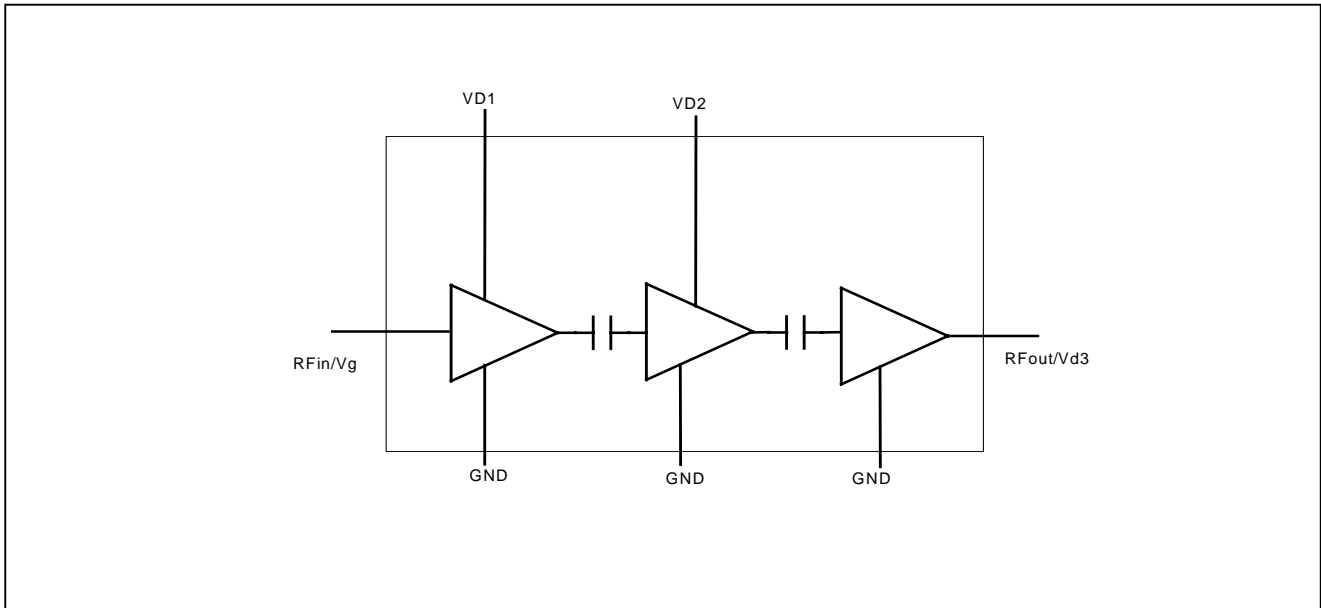

Maximum ratings

Characteristics	Symbol	max. Value	Unit
Positive supply voltage	V_D	6	V
Supply current	I_D	1.0	A
Maximum input power	P_{inmax}	20	dBm
Channel temperature	T_{Ch}	150	°C
Storage temperature	T_{stg}	-55...+150	°C
Total power dissipation ($T_s \leq 81\text{ °C}$) <i>T_s: Temperature at soldering point</i>	P_{tot}	1.0	W
Pulse peak power	P_{Pulse}	2.0	W

Thermal Resistance

Characteristics	Symbol	max. Value	Unit
Channel-soldering point	R_{thChS}	70	K/W

Functional Block Diagram

Pin #	Name	Configuration
1	RFin/Vg	RF input power + Gate voltage [0V internal]
2	GND	RF and DC ground
3	VD2	Pos. drain voltage of the 2nd stage
4	n.c.	not connected
5	n.c.	not connected
6	RFout/VD3	RF output power / Pos. drain voltage of the 3rd stage
7	GND	RF and DC ground
8	VD1	Pos. drain voltage of the 1st stage

DC characteristics

Characteristics		Symbol	Conditions	min	typ	max	Unit
Drain current	stage 1	<i>IDSS1</i>	VD1=3V		45		mA
	stage 2	<i>IDSS2</i>	VD2=3V		65		mA
	stage 3	<i>IDSS2</i>	VD2=3V		340		mA
Transconductance	stage 1	<i>gfs1</i>	VD=3V, ID=50mA		110		mS
	stage 2	<i>gfs2</i>	VD=3V, ID=300mA		650		mS
	stage 3	<i>gfs3</i>	VD=3V, ID=300mA		650		mS

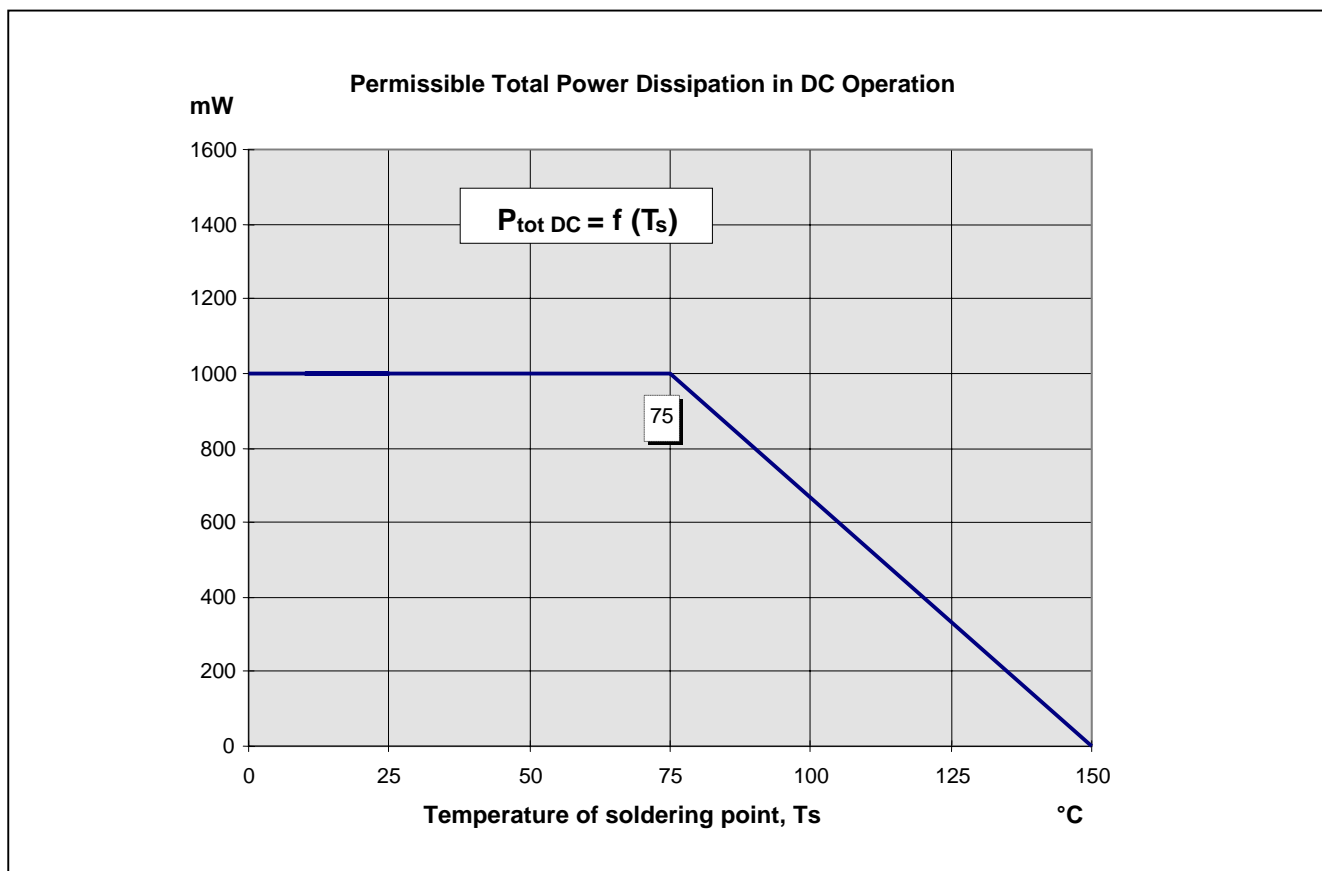

Determination of Permissible Total Power Dissipation for Continuous and Pulse Operation

The dissipated power is the power which remains in the chip and heats the device. It does not contain RF signals which are coupled out consistently.

a) Continuous Wave / DC Operation

For the determination of the permissible total power dissipation $P_{\text{tot-DC}}$ from the diagram below it is necessary to obtain the temperature of the soldering point T_S first. There are two cases:

- When R_{thSA} (soldering point to ambient) is not known: Measure T_S with a temperature sensor at the leads where the heat is transferred from the device to the board (normally at the widest source or ground lead for GaAs). Use a small sensor of low heat transport, for example a thermoelement (< 1mm) with thin wires or a temperature indicating paper while the device is operating.
- When R_{thSA} is already known: $T_S = P_{\text{diss}} \times R_{\text{thSA}} + T_A$

b) Pulsed Operation

For the calculation of the permissible pulse load $P_{tot-max}$ the following formula is applicable:

$$P_{tot-max} = P_{tot-DC} \times \text{Pulse factor}$$

$$= P_{tot-DC} \times (P_{tot-max} / P_{tot-DC})$$

Use the values for P_{tot-DC} as derived from the above diagram and for the

$$\text{pulse factor} = P_{tot-max} / P_{tot-DC}$$

from the following diagram to get a specific value.

Pulse factor:

$P_{tot-max}$ should not exceed the absolute maximum rating for the dissipated power
 $P_{Pulse} = \text{ " Pulse peak power " } = 2 \text{ W}$

c) Reliability Considerations

This procedure yields the upper limit for the power dissipation for continuous wave (cw) and pulse applications which corresponds to the maximum allowed channel temperature. For best reliability keep the channel temperature low. The following formula allows to track the individual contributions which determine the channel temperature.

T_{ch}	=	$(P_{diss} \times$	$R_{thChS})$	+	T_S
Channel temperature (= junction temperature)		Power dissipated in the chip. It does not contain decoupled RF-power		Rth of device from channel to soldering point	Temperature of soldering point, measured or calculated

Electrical characteristics [3.0V DECT-Application: PCB-Layout see page 9]

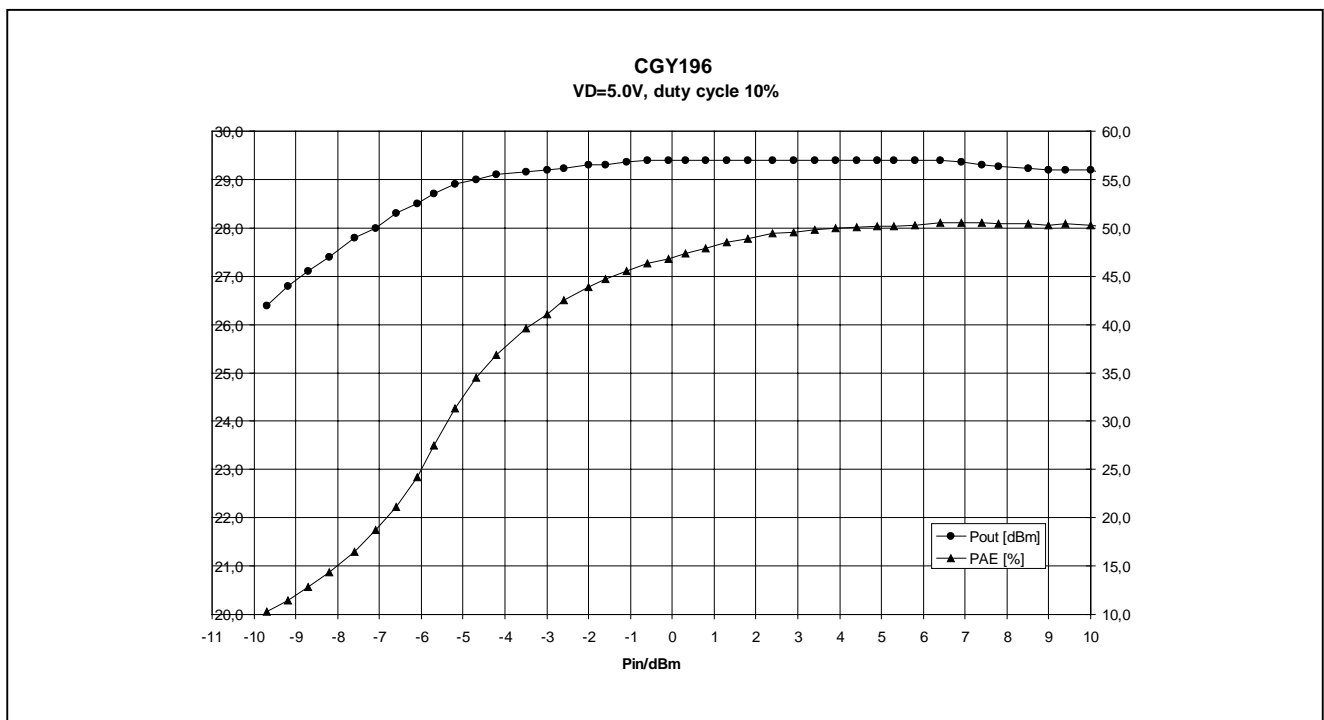

($T_A = 25^\circ\text{C}$, $f=1.89\text{ GHz}$, $Z_S=Z_L=50\text{ Ohm}$, unless otherwise specified)

Characteristics	Symbol	min	typ	max	Unit
Supply current <i>VD=3.0V; Pin = +0 dBm</i>	I_{DD}	-	300	-	mA
