

CLEAR LOGIC

# LIBERATOR CL1K100

## Key Features

- ◆ Fully Compatible to the Altera® ACEX® 1K Family
- ◆ Prototype Your System With Altera FPGAs
- ◆ Seamlessly Migrate Production To Clear Logic
- ◆ No ASIC Engineering, No NRE, And No Test Vector Development
- ◆ Very Fast, Dense Signal Routing Using Vertical Link Interconnect
- ◆ "Gate Array" Option Eliminates Configuration EPROMs
- ◆ Fabricated Using 0.35 Micron CMOS Process
- ◆ Very Low Power Consumption (Active And Standby)
- ◆ High Density
  - 100,000 Usable Gates
  - 4,992 Logic Elements
  - 49,152 RAM Bits
  - 333 Maximum User I/O Pins

## CL1K Product Family Overview

Parameter	CL1K30	CL1K50	CL1K100
Typical Gates (Logic and RAM)	30,000	50,000	100,000
Maximum System Gates	119,000	199,000	257,000
Logic Elements	1,728	2,880	4,992
Embedded Array Blocks	6	10	12
Total RAM Bits	24,576	40,960	49,152
Max User I/O pins	171	249	333
Speed Grades	-1, -2, -3	-1, -2, -3	-1, -2, -3
Packages	144-pin TQFP 208-pin PQFP 256-pin FBGA	144-pin TQFP 208-pin PQFP 256-pin FBGA 484-pin FBGA	208-pin PQFP 256-pin FBGA 484-pin FBGA

1K tbl 01

**Description**

The LIBERATOR™ CL1K family offers you all of the time-to-market benefits of designing with programmable logic. Simply use Altera ACEX® 1K FPGAs to prototype and verify the design. Then, take five minutes to submit the bitstream using Clear Logic's web site! Within eight weeks, your system can be in volume production using compatible Clear Logic devices.

LIBERATOR technology frees you to completely design, prototype, and verify your custom logic using Altera ACEX 1K products. Clear Logic's innovative technology eliminates NRE costs, test vector development, ordering minimums, and long lead times. No re-simulation or re-layout is required, because Clear Logic offers an architecture that is exactly compatible to the functionality of the FPGA prototype. Clear Logic's NoFault® test technology ensures complete test coverage through the use of special scan test registers.

The LIBERATOR family is based upon an array of logic elements. Each logic element contains a configurable look-up table for combinatorial functions and a register for sequential operations. Eight logic elements in a group form a block. Logic functions and signal routing are defined by Clear Logic's proprietary vertical metal links.

Laser-based configuration allows quick-turn prototyping and eliminates NRE costs for photomasks. Inherent CL1K family performance benefits include extremely consistent propagation delays, reduced power consumption, and improved immunity to noise and upset events.

**Configuration**

The "Gate Array" configuration mode eliminates the need for external EPROMs or software configuration. The LIBERATOR device is already factory-configured when it is shipped. When using the device in the "Gate Array" mode, it powers up fully configured. In this mode, if the customer selects INIT\_DONE option, this pin will always be high.

**Additional  
Information**

For further information on designing with the CL1K LPLD® family, please refer to the following documents (all CL10K documents also pertain to the CL1K devices):

- ◆ AN-01: Requesting a First Article. This document provides instructions on how to request first articles by submitting a bitstream file to Clear Logic's web site.
- ◆ AN-02: Clear Logic Packaging Guide. This document provides specifications and drawings for packages used by the CL10K family and other Clear Logic devices.
- ◆ AN-13: LIBERATOR -- A New Way To Design. This document describes the most efficient path for custom logic designs up to 200K gates using FPGA design techniques and going to production with Clear Logic.
- ◆ AN-14: CL10K Technology White Paper. This document outlines the technologies employed by the LIBERATOR family.
- ◆ AN-15: LIBERATOR System Configuration. This document contains a detailed discussion of all aspects of configuring CL10K-based systems.
- ◆ AN-16: Introduction to the Clear Logic Verilog Model Generator. Clear Logic now has Verilog models of your FPGA converted design. Learn what it is and how it can help you.
- ◆ AN-17: Clear Logic LIBERATOR Design Models. This document outlines the capabilities and freedom available in the Clear Logic Verilog and VHDL design models.
- ◆ AN-18: Debugging Designs Using Clear Logic Models. This document shows the enhanced troubleshooting capabilities that the Clear Logic LIBERATOR Verilog/VHDL design models bring to the system debugging process.

$t_{INHIDIR}$	Hold Time for Bi-directional Pins with Global Clock at Adjacent LE Registers	0.0		0.0		0.0		ns
$t_{OUTCOBIDIR}$	Clock-to-output Delay for Bi-directional Pins with Global Clock at IOE Register	2.0	3.7	2.0	4.4	2.0	6.3	ns
$t_{XZBIDIR}$	Synchronous IOE Output Buffer Disable Delay	2.0	5.2	2.0	6.1	2.0	8.3	ns
$t_{ZXBIDIR}$	Synchronous IOE Output Buffer Disable Delay, Slow Slew Rate = off	2.0	4.7	2.0	5.6	2.0	8.1	ns

1K tbl 12B

**AC Test Conditions**

A: Test fixture set-up A is for general testing.  
 B: Test fixture set-up B is for high Z testing ( $t_{ZX\#}$ ).

**Notes to Tables**

1. During transitions, inputs may undershoot to -2.0V or overshoot to 5.75V for periods shorter than 20ns. Otherwise, minimum DC input voltage is -0.5V.
2. Device inputs may be driven before  $V_{CCINT}$  and  $V_{CCIO}$  are powered.
3. Typical values are at  $V_{CC}$  of 3.3 volts and ambient temperature of 25 °C.
4. Guaranteed but not tested. Characterized initially, and after any design changes which may affect these parameters.
5. Internal timing delays are based on characterization, and cannot be explicitly tested. Internal timing parameters should be used for performance estimation only.
6. Use AC Test Conditions set-up B for these parameters.
