

US Audio Multiplexing Decoder

Description

The CXA2164Q is an IC designed as a decoder for the Zenith TV Multi-channel System and also corresponds with I²C BUS. Functions include stereo demodulation, SAP (Separate Audio Program) demodulation, dbx noise reduction, and sound processor. Various kinds of filters are built in this IC. Adjustment, mode control and sound processor control are all executed through I²C BUS.

Features

- Alignment-free VCO and filter
 - Audio multiplexing decoder, dbx noise reduction decoder, sound processor
 - One external input
 - Volume control
- are all included in a single chip. Almost any sort of signal processing is possible through this IC.
- Input level, separation adjustments and each mode control are possible through I²C BUS.

Absolute Maximum Ratings (Ta = 25°C)

• Supply voltage	V _{CC}	11	V
• Operating temperature	T _{opr}	-20 to +75	°C
• Storage temperature	T _{stg}	-65 to +150	°C
• Allowable power dissipation	P _D	0.6	W

Range of Operating Supply Voltage

9 ± 0.5 V

Applications

TV, VCR and other decoding systems for US audio multiplexing TV broadcasting

Structure

Bipolar silicon monolithic IC

Note

(SAP) : The SAPOUT output signal is soft muted (approximately -7dB).

The signal is soft muted when NOISE = 1.

* : Don't care.

*1 SAP or NOISE discrimination may be made during MONO or STEREO input when the noise is inputted in the weak electric field.

Then microcomputer reads "NOISE" status from IC and decides whether SAP is outputted.

"NOISE" status rises earlier than "SAP" status when the amount of noise is increased to COMPIN.

Description of Operation

The US audio multiplexing system possesses the base band spectrum shown in Fig. 1.

Fig. 1. Base band spectrum

Fig. 2. Overall block diagram (See Fig. 3 for the dbx-TV block)

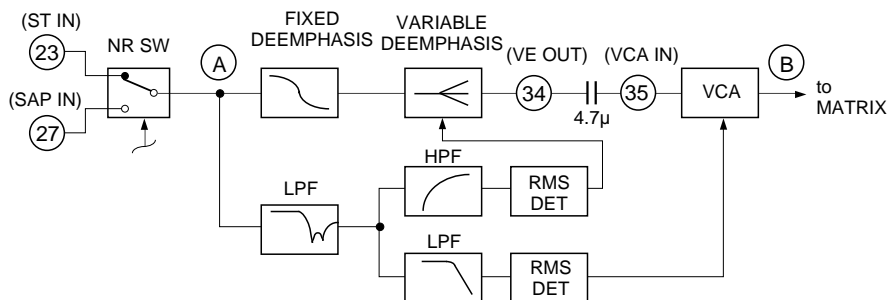

Fig 3. dbx-TV block

(1) L + R (MAIN)

After the audio multiplexing signal input from COMPIN (Pin 12) passes through MVCA, the SAP signal and telemetry signal are suppressed by STEREO LPF. Next, the pilot signals are canceled. Finally, the L – R signal and SAP signal are removed by MAIN LPF, and frequency characteristics are flattened (de-emphasized) and input to the matrix.

(2) L – R (SUB)

The L – R signal follows the same course as L + R before the pilot signal is canceled. L – R has no carrier signal, as it is a suppressed-carrier double-sideband amplitude modulated signal (DSB-AM modulated). For this reason, the pilot signal is used to regenerate the carrier signal (quasi-sine wave) to be used for the demodulation of the L – R signal. In the last stage, the residual high frequency components are removed by SUB LPF and the L – R signal is input to the dbx-TV block via the NRSW circuit after passing through SUBVCA.

(3) SAP

SAP is an FM signal using 5fH as a carrier as shown in the Fig. 1. First, the SAP signal only is extracted using SAP BPF. Then, this is subjected to FM detection. Finally, residual high frequency components are removed and frequency characteristics flattened using SAP LPF, and the SAP signal is input to the dbx-TV block via the NRSW circuit. When there is no SAP signal, the Pin 25 output is soft muted.

(4) Mode discrimination

Stereo discrimination is performed by detecting the pilot signal amplitude. SAP discrimination is performed by detecting the 5fH carrier amplitude. NOISE discrimination is performed by detecting the noise near 25kHz after FM detection of SAP signal.

(5) dbx-TV block

Either the L – R signal or SAP signal input respectively from ST IN (Pin 23) or SAP IN (Pin 27) is selected by the mode control and input to the dbx-TV block.

The input signal then passes through the fixed de-emphasis circuit and is applied to the variable de-emphasis circuit. The signal output from the variable de-emphasis circuit passes through an external capacitor and is applied to VCA (voltage control amplifier). Finally, the VCA output is converted from a current to a voltage using an operational amplifier and then input to the matrix.

The variable de-emphasis circuit transmittance and VCA gain are respectively controlled by Each of effective value detection circuits. Each of the effective value detection circuits passes the input signal through a predetermined filter for weighting before the effective value of the weighted signal is detected to provide the control signal.

(6) Matrix, TVSW

The signals (L + R, L – R, SAP) input to "MATRIX" become the outputs for the ST-L, ST-R, MONO and SAP signals according to the mode control and whether there is ST / SAP discrimination.

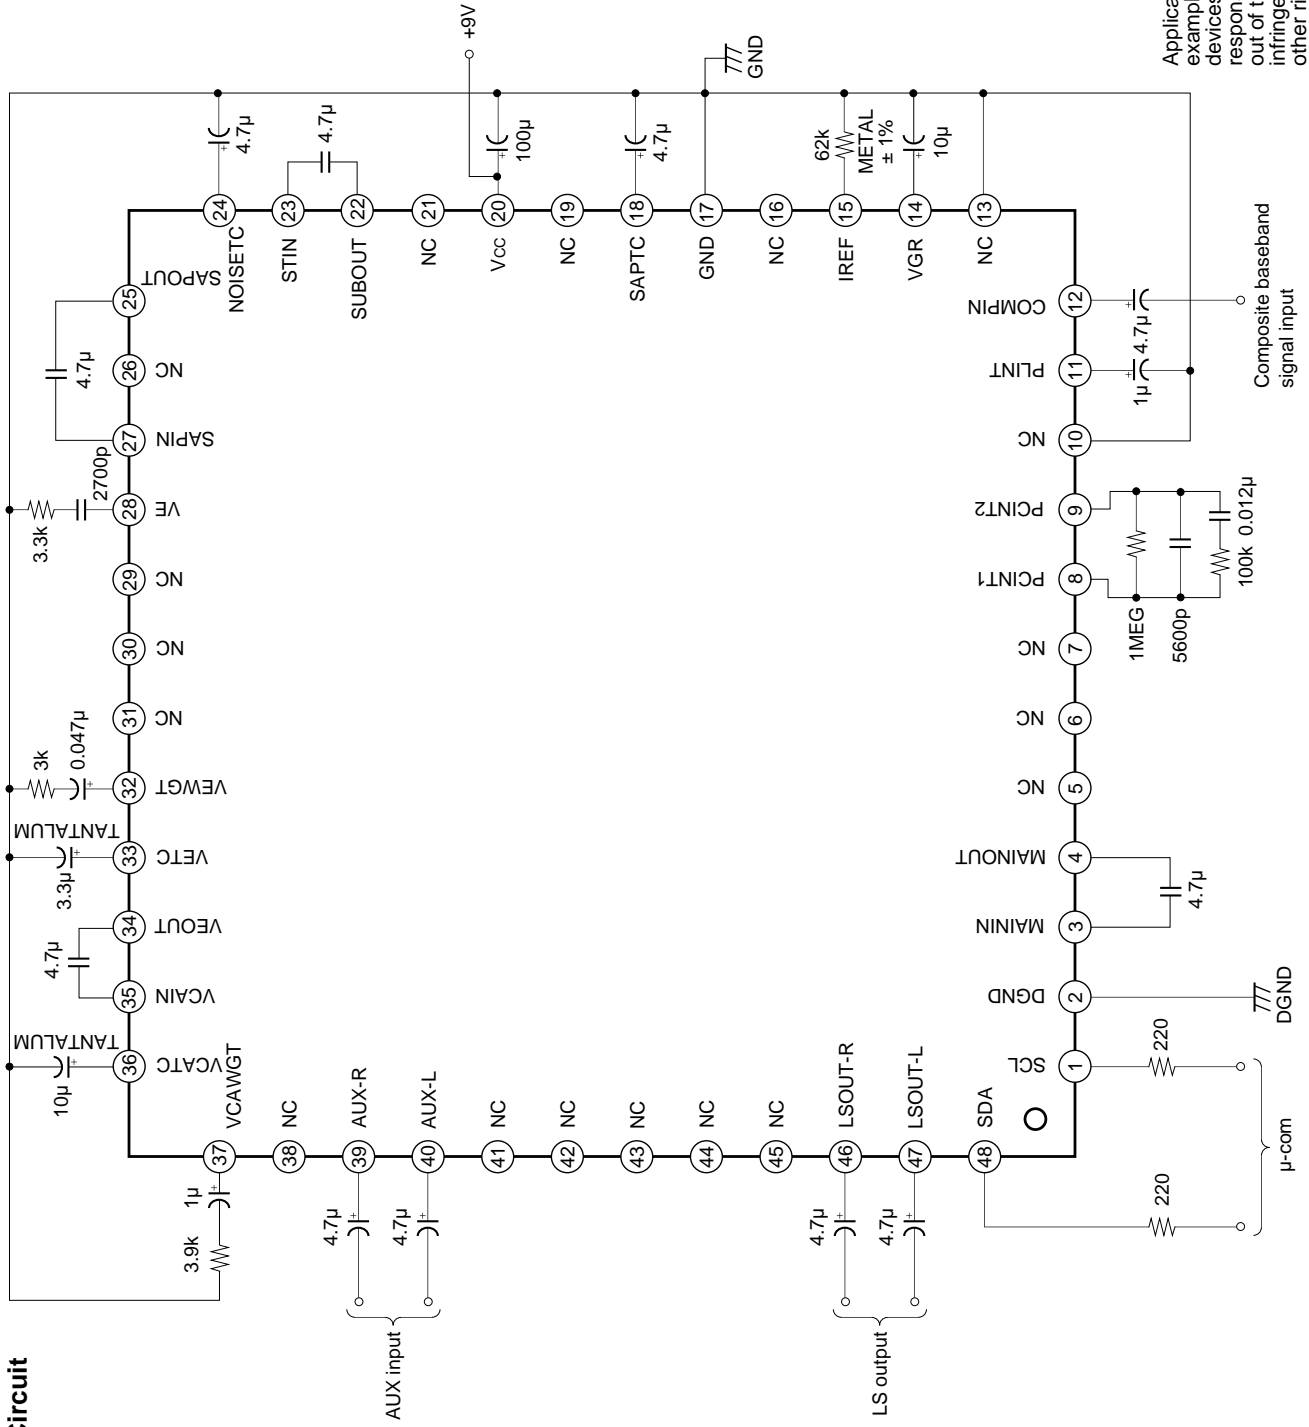

"TVSW" switches the "MATRIX" output signal and external input signal.

(7) Others

"MVCA" is a VCA which adjusts the input signal level to the standard level of this IC.

"Bias" supplies the reference voltage and reference current to the other blocks. The current flowing to the resistor connecting IREF (Pin 15) with GND become the reference current.

Application Circuit

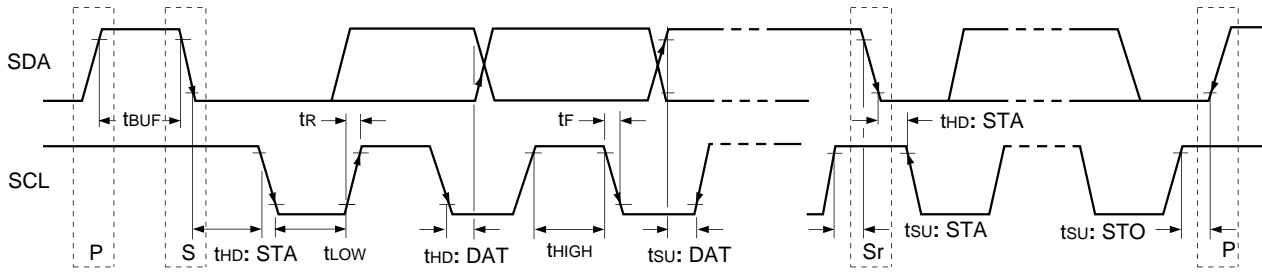

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

1	High level input voltage	V _{IH}	3.0	—	5.0	V
2	Low level input voltage	V _{IL}	0	—	1.5	
3	High level input current	I _{IH}	—	—	10	μA
4	Low level input current	I _{IL}	—	—	10	
5	Low level output voltage SDA (Pin 48) during 3mA inflow	V _{OL}	0	—	0.4	V
6	Maximum inflow current	I _{OL}	3	—	—	mA
7	Input capacitance	C _I	—	—	10	pF
8	Maximum clock frequency	f _{SCL}	0	—	100	kHz
9	Minimum waiting time for data change	t _{BUF}	4.7	—	—	μs
10	Minimum waiting time for start of data transfer	t _{HD: STA}	4.0	—	—	
11	Low level clock pulse width	t _{LOW}	4.7	—	—	
12	High level clock pulse width	t _{HIGH}	4.0	—	—	
13	Minimum waiting time for start preparation	t _{SU: STA}	4.7	—	—	
14	Minimum data hold time	t _{HD: DAT}	0	—	—	
15	Minimum data preparation time	t _{SU: DAT}	250	—	—	ns
16	Rise time	t _R	—	—	1	μs
17	Fall time	t _F	—	—	300	ns
18	Minimum waiting time for stop preparation	t _{SU: STO}	4.7	—	—	μs

I²C BUS load conditions: Pull-up resistor 4kΩ (Connect to +5V)
Load capacity 200pF (Connect to GND)

I²C BUS Control Signal

I²C BUS Signal

There are two I²C signals, SDA (Serial DATA) and SCL (Serial CLOCK) signals. SDA is a bidirectional signal.

- Accordingly there are 3 values outputs, H, L and HIZ.

- I²C transfer begins with Start Condition and ends with Stop Condition.

• I²C data Write (Write from I²C controller to the IC)

• I²C data Read (Read from the IC to I²C controller)

• Read timing

* Data Read is performed during SCL rise.

Package Outline

Unit: mm

48PIN QFP (PLASTIC)

PACKAGE STRUCTURE

SONY CODE	QFP-48P-L04
EIAJ CODE	QFP048-P-1212
JEDEC CODE	_____

PACKAGE MATERIAL	EPOXY RESIN
LEAD TREATMENT	PALLADIUM PLATING
LEAD MATERIAL	COPPER ALLOY
PACKAGE MASS	0.7g
