

Features

- 20 ns, 25 ns, and 45 ns access times
- Internally organized as 512 K × 8 (CY14B104LA) or 256 K × 16 (CY14B104NA)
- Hands off automatic STORE on power-down with only a small capacitor
- STORE to QuantumTrap nonvolatile elements initiated by software, device pin, or AutoStore on power-down
- RECALL to SRAM initiated by software or power-up
- Infinite read, write, and recall cycles
- 1 million STORE cycles to QuantumTrap
- 20 year data retention
- Single 3 V +20%, -10% operation
- Industrial temperature

■ Packages

- 44-/54-pin thin small outline package (TSOP II)
- 48-ball fine-pitch ball grid array (FBGA)

■ Pb-free and restriction of hazardous substances (RoHS) compliant

Functional Description

The Cypress CY14B104LA/CY14B104NA is a fast static RAM (SRAM), with a nonvolatile element in each memory cell. The memory is organized as 512 K bytes of 8 bits each or 256 K words of 16 bits each. The embedded nonvolatile elements incorporate QuantumTrap technology, producing the world's most reliable nonvolatile memory. The SRAM provides infinite read and write cycles, while independent nonvolatile data resides in the highly reliable QuantumTrap cell. Data transfers from the SRAM to the nonvolatile elements (the STORE operation) takes place automatically at power-down. On power-up, data is restored to the SRAM (the RECALL operation) from the nonvolatile memory. Both the STORE and RECALL operations are also available under software control.

Logic Block Diagram^[1, 2, 3]

Notes

1. Address A₀ - A₁₈ for ×8 configuration and Address A₀ - A₁₇ for ×16 configuration.
2. Data DQ₀ - DQ₇ for ×8 configuration and Data DQ₀ - DQ₁₅ for ×16 configuration.
3. BHE and BLE are applicable for ×16 configuration only.

Figure 3. Pin Diagram - 54-Pin TSOP II (x16)

Table 1. Pin Definitions

Pin Name	I/O Type	Description
A ₀ – A ₁₈	Input	Address inputs. Used to select one of the 524,288 bytes of the nvSRAM for x8 Configuration.
A ₀ – A ₁₇		Address inputs. Used to Select one of the 262,144 words of the nvSRAM for x16 Configuration.
DQ ₀ – DQ ₇	Input/Output	Bidirectional data I/O lines for x8 configuration. Used as input or output lines depending on operation.
DQ ₀ – DQ ₁₅		Bidirectional data I/O lines for x16 configuration. Used as input or output lines depending on operation.
WE	Input	Write Enable input, Active LOW. When selected LOW, data on the I/O pins is written to the specific address location.
\overline{CE}	Input	Chip Enable input, Active LOW. When LOW, selects the chip. When HIGH, deselects the chip.
\overline{OE}	Input	Output Enable, Active LOW. The active LOW OE input enables the data output buffers during read cycles. I/O pins are tristated on deasserting OE HIGH.
\overline{BHE}	Input	Byte High Enable, Active LOW. Controls DQ ₁₅ - DQ ₈ .
\overline{BLE}	Input	Byte Low Enable, Active LOW. Controls DQ ₇ - DQ ₀ .
V _{SS}	Ground	Ground for the device. Must be connected to the ground of the system.
V _{CC}	Power supply	Power supply inputs to the device.
$\overline{HSB}^{[7]}$	Input/Output	Hardware STORE Busy (HSB). When LOW this output indicates that a Hardware STORE is in progress. When pulled LOW external to the chip it initiates a nonvolatile STORE operation. After each Hardware and Software STORE operation, HSB is driven HIGH for a short time (t _{HHD}) with standard output high current, and then a weak internal pull-up resistor keeps this pin HIGH (external pull-up resistor connection optional).
V _{CAP}	Power supply	AutoStore Capacitor. Supplies power to the nvSRAM during power loss to store data from SRAM to nonvolatile elements.
NC	No connect	No Connect. This pin is not connected to the die.

Note
7. HSB pin is not available in 44-TSOP II (x16) package.

Device Operation

The CY14B104LA/CY14B104NA nvSRAM is made up of two functional components paired in the same physical cell. They are a SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM is transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to the SRAM (the RECALL operation). Using this unique architecture, all cells are stored and recalled in parallel. During the STORE and RECALL operations, SRAM read and write operations are inhibited. The CY14B104LA/CY14B104NA supports infinite reads and writes similar to a typical SRAM. In addition, it provides infinite RECALL operations from the nonvolatile cells and up to 1 million STORE operations. Refer to the [Truth Table For SRAM Operations](#) on page 17 for a complete description of read and write modes.

SRAM Read

The CY14B104LA/CY14B104NA performs a read cycle when CE and OE are LOW and WE and HSB are HIGH. The address specified on pins A₀₋₁₈ or A₀₋₁₇ determines which of the 524,288 data bytes or 262,144 words of 16 bits each are accessed. Byte enables (BHE, BLE) determine which bytes are enabled to the output, in the case of 16-bit words. When the read is initiated by an address transition, the outputs are valid after a delay of t_{AA} (read cycle 1). If the read is initiated by CE or OE, the outputs are valid at t_{ACE} or at t_{DOE}, whichever is later (read cycle 2). The data output repeatedly responds to address changes within the t_{AA} access time without the need for transitions on any control input pins. This remains valid until another address change or until CE or OE is brought HIGH, or WE or HSB is brought LOW.

SRAM Write

A write cycle is performed when \overline{CE} and \overline{WE} are LOW and \overline{HSB} is HIGH. The address inputs must be stable before entering the write cycle and must remain stable until CE or WE goes HIGH at the end of the cycle. The data on the common I/O pins DQ₀₋₁₅ are written into the memory if the data is valid (t_{SD} time) before the end of a WE controlled write or before the end of an CE controlled write. The Byte Enable inputs (BHE, BLE) determine which bytes are written, in the case of 16-bit words. It is recommended that OE be kept HIGH during the entire write cycle to avoid data bus contention on common I/O lines. If OE is left LOW, internal circuitry turns off the output buffers t_{HZWE} after WE goes LOW.

AutoStore Operation

The CY14B104LA/CY14B104NA stores data to the nvSRAM using one of the following three storage operations: Hardware STORE activated by the HSB; Software STORE activated by an address sequence; AutoStore on device power-down. The AutoStore operation is a unique feature of QuantumTrap technology and is enabled by default on the CY14B104LA/CY14B104NA.

During a normal operation, the device draws current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge is used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH}, the part automatically disconnects the V_{CAP} pin from V_{CC}. A STORE operation is initiated with power provided by the V_{CAP} capacitor.

Note

8. HSB pin is not available in 44-TSOP II (x16) package.

Note If the capacitor is not connected to V_{CAP} pin, AutoStore must be disabled using the soft sequence specified in [Preventing AutoStore](#) on page 7. In case AutoStore is enabled without a capacitor on V_{CAP} pin, the device attempts an AutoStore operation without sufficient charge to complete the Store. This corrupts the data stored in nvSRAM.

Figure 4 shows the proper connection of the storage capacitor (V_{CAP}) for automatic store operation. Refer to [DC Electrical Characteristics](#) on page 9 for the size of V_{CAP}. The voltage on the V_{CAP} pin is driven to V_{CC} by a regulator on the chip. A pull-up should be placed on WE to hold it inactive during power-up. This pull-up is effective only if the WE signal is tristate during power-up. Many MPUs tristate their controls on power-up. This should be verified when using the pull-up. When the nvSRAM comes out of power-on-RECALL, the MPU must be active or the WE held inactive until the MPU comes out of reset.

To reduce unnecessary nonvolatile stores, AutoStore and hardware STORE operations are ignored unless at least one write operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a write operation has taken place. The HSB signal is monitored by the system to detect if an AutoStore cycle is in progress.

Figure 4. AutoStore Mode

Hardware STORE Operation

The CY14B104LA/CY14B104NA provides the \overline{HSB} ^[8] pin to control and acknowledge the STORE operations. The \overline{HSB} pin is used to request a hardware STORE cycle. When the \overline{HSB} pin is driven LOW, the CY14B104LA/CY14B104NA conditionally initiates a STORE operation after t_{DELAY}. An actual STORE cycle only begins if a write to the SRAM has taken place since the last STORE or RECALL cycle. The \overline{HSB} pin also acts as an open drain driver (internal 100 kΩ weak pull-up resistor) that is internally driven LOW to indicate a busy condition when the STORE (initiated by any means) is in progress.

Note After each Hardware and Software STORE operation \overline{HSB} is driven HIGH for a short time (t_{HHD}) with standard output high current and then remains HIGH by internal 100 kΩ pull-up resistor.

SRAM write operations that are in progress when $\overline{\text{HSB}}$ is driven LOW by any means are given time (t_{DELAY}) to complete before the STORE operation is initiated. However, any SRAM write cycles requested after $\overline{\text{HSB}}$ goes LOW are inhibited until $\overline{\text{HSB}}$ returns HIGH. In case the write latch is not set, $\overline{\text{HSB}}$ is not driven LOW by the CY14B104LA/CY14B104NA. But any SRAM read and write cycles are inhibited until $\overline{\text{HSB}}$ is returned HIGH by MPU or other external source.

During any STORE operation, regardless of how it is initiated, the CY14B104LA/CY14B104NA continues to drive the $\overline{\text{HSB}}$ pin LOW, releasing it only when the STORE is complete. Upon completion of the STORE operation, the nvSRAM memory access is inhibited for t_{LZHSB} time after $\overline{\text{HSB}}$ pin returns HIGH. Leave the $\overline{\text{HSB}}$ unconnected if it is not used.

Hardware RECALL (Power-Up)

During power-up or after any low power condition ($V_{\text{CC}} < V_{\text{SWITCH}}$), an internal RECALL request is latched. When V_{CC} again exceeds the V_{SWITCH} on powerup, a RECALL cycle is automatically initiated and takes t_{HRECALL} to complete. During this time, the $\overline{\text{HSB}}$ pin is driven LOW by the $\overline{\text{HSB}}$ driver and all reads and writes to nvSRAM are inhibited.

Software STORE

Data is transferred from the SRAM to the nonvolatile memory by a software address sequence. The CY14B104LA/CY14B104NA software STORE cycle is initiated by executing sequential $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read cycles from six specific address locations in exact order. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. After a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of reads from specific addresses is used for STORE initiation, it is important that no other read or write accesses intervene in the sequence, or the sequence is aborted and no STORE or RECALL takes place.

To initiate the software STORE cycle, the following read sequence must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8FC0 Initiate STORE cycle

The software sequence may be clocked with $\overline{\text{CE}}$ controlled reads or $\overline{\text{OE}}$ controlled reads, with $\overline{\text{WE}}$ kept HIGH for all the six READ sequences. After the sixth address in the sequence is entered, the STORE cycle commences and the chip is disabled. $\overline{\text{HSB}}$ is driven LOW. After the t_{STORE} cycle time is fulfilled, the SRAM is activated again for the read and write operation.

Software RECALL

Data is transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of read operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, perform the following sequence of $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read operations must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4C63 Initiate RECALL cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared; then, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time, the SRAM is again ready for read and write operations. The RECALL operation does not alter the data in the nonvolatile elements.

Table 2. Mode Selection

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	$\overline{\text{BHE}}, \overline{\text{BLE}}^{[9]}$	$A_{15} - A_0^{[10]}$	Mode	I/O	Power
H	X	X	X	X	Not selected	Output high-Z	Standby
L	H	L	L	X	Read SRAM	Output data	Active
L	L	X	L	X	Write SRAM	Input data	Active
L	H	L	X	0x4E38 0xB1C7 0x83E0 0x7C1F 0x703F 0x8B45	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM AutoStore Disable	Output data Output data Output data Output data Output data Output data	Active ^[11]

Notes

9. $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ are applicable for x16 configuration only.
10. While there are 19 address lines on the CY14B104LA (18 address lines on the CY14B104NA), only 13 address lines ($A_{14} - A_2$) are used to control software modes. The remaining address lines are don't care.
11. The six consecutive address locations must be in the order listed. $\overline{\text{WE}}$ must be HIGH during all six cycles to enable a nonvolatile cycle.

Table 2. Mode Selection (continued)

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	$\overline{\text{BHE}}, \overline{\text{BLE}}^{[9]}$	$\text{A}_{15} - \text{A}_0^{[10]}$	Mode	I/O	Power

Preventing AutoStore

The AutoStore function is disabled by initiating an AutoStore disable sequence. A sequence of read operations is performed in a manner similar to the software STORE initiation. To initiate the AutoStore disable sequence, the following sequence of $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8B45 AutoStore Disable

The AutoStore is re-enabled by initiating an AutoStore enable sequence. A sequence of read operations is performed in a manner similar to the software RECALL initiation. To initiate the AutoStore enable sequence, the following sequence of $\overline{\text{CE}}$ or $\overline{\text{OE}}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4B46 AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (hardware or software) must be issued to save the AutoStore state through subsequent power-down cycles. The part comes from the factory with AutoStore enabled.

Data Protection

The CY14B104LA/CY14B104NA protects data from corruption during low voltage conditions by inhibiting all externally initiated STORE and write operations. The low voltage condition is detected when $V_{CC} < V_{SWITCH}$. If the CY14B104LA/CY14B104NA is in a write mode (both $\overline{\text{CE}}$ and $\overline{\text{WE}}$ are LOW) at power-up, after a RECALL or STORE, the write is inhibited until the SRAM is enabled after t_{LZHSB} (HSB to output active). This protects against inadvertent writes during power-up or brown out conditions.

Noise Considerations

Refer to CY application note [AN1064](#).

Best Practices

nvSRAM products have been used effectively for over 27 years. While ease-of-use is one of the product's main system values, experience gained working with hundreds of applications has resulted in the following suggestions as best practices:

- The nonvolatile cells in this nvSRAM product are delivered from Cypress with 0x00 written in all cells. Incoming inspection routines at customer or contract manufacturer's sites sometimes reprogram these values. Final NV patterns are typically repeating patterns of AA, 55, 00, FF, A5, or 5A. End product's firmware should not assume an NV array is in a set programmed state. Routines that check memory content values to determine first time system configuration, cold or warm boot status, and so on should always program a unique NV pattern (that is, complex 4-byte pattern of 46 E6 49 53 hex or more random bytes) as part of the final system manufacturing test to ensure these system routines work consistently.
- power-up boot firmware routines should rewrite the nvSRAM into the desired state (for example, AutoStore enabled). While the nvSRAM is shipped in a preset state, best practice is to again rewrite the nvSRAM into the desired state as a safeguard against events that might flip the bit inadvertently such as program bugs and incoming inspection routines.
- The V_{CAP} value specified in this datasheet includes a minimum and a maximum value size. Best practice is to meet this requirement and not exceed the maximum V_{CAP} value because the nvSRAM internal algorithm calculates V_{CAP} charge and discharge time based on this maximum V_{CAP} value. Customers that want to use a larger V_{CAP} value to make sure there is extra store charge and store time should discuss their V_{CAP} size selection with Cypress to understand any impact on the V_{CAP} voltage level at the end of a t_{RECALL} period.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

- Storage temperature -65 °C to +150 °C
- Maximum accumulated storage time
 - At 150 °C ambient temperature.....1000 h
 - At 85 °C ambient temperature..... 20 Years
- Ambient temperature with power applied -55 °C to +150 °C
- Supply voltage on V_{CC} relative to V_{SS}.....-0.5 V to 4.1 V
- Voltage applied to outputs in high-Z state -0.5 V to V_{CC} + 0.5 V
- Input voltage-0.5 V to V_{CC} + 0.5 V

- Transient voltage (<20 ns) on any pin to ground potential -2.0 V to V_{CC} + 2.0 V
- Package power dissipation capability (T_A = 25 °C) 1.0 W
- Surface mount Pb soldering temperature (3 Seconds)..... +260 °C
- DC output current (1 output at a time, 1s duration) 15 mA
- Static discharge voltage..... > 2001 V (per MIL-STD-883, Method 3015)
- Latch up current..... > 200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Industrial	-40 °C to +85 °C	2.7 V to 3.6 V

DC Electrical Characteristics

Over the Operating Range (V_{CC} = 2.7 V to 3.6 V)

Parameter	Description	Test Conditions	Min	Typ ^[12]	Max	Unit
V _{CC}	Power supply		2.7	3.0	3.6	V
I _{CC1}	Average V _{CC} current	t _{RC} = 20 ns t _{RC} = 25 ns t _{RC} = 45 ns Values obtained without output loads (I _{OUT} = 0 mA)	-	-	70 70 52	mA mA mA
I _{CC2}	Average V _{CC} current during STORE	All inputs don't care, V _{CC} = Max Average current for duration t _{STORE}	-	-	10	mA
I _{CC3}	Average V _{CC} current at t _{RC} = 200 ns, V _{CC} (Typ), 25 °C	All inputs cycling at CMOS levels. Values obtained without output loads (I _{OUT} = 0 mA).	-	35	-	mA
I _{CC4}	Average V _{CAP} current during AutoStore cycle	All inputs don't care. Average current for duration t _{STORE}	-	-	5	mA
I _{SB}	V _{CC} standby current	CE ≥ (V _{CC} - 0.2 V). V _{IN} ≤ 0.2 V or ≥ (V _{CC} - 0.2 V). Standby current level after nonvolatile cycle is complete. Inputs are static. f = 0 MHz.	-	-	5	mA
I _{IX} ^[13]	Input leakage current (except HSB)	V _{CC} = Max, V _{SS} ≤ V _{IN} ≤ V _{CC}	-1	-	+1	μA
	Input leakage current (for HSB)	V _{CC} = Max, V _{SS} ≤ V _{IN} ≤ V _{CC}	-100	-	+1	μA
I _{OZ}	Off-state output leakage current	V _{CC} = Max, V _{SS} ≤ V _{OUT} ≤ V _{CC} , CE or OE ≥ V _{IH} or BHE/BLE ≥ V _{IH} or WE ≤ V _{IL}	-1	-	+1	μA
V _{IH}	Input HIGH voltage		2.0	-	V _{CC} + 0.5	V
V _{IL}	Input LOW voltage		V _{SS} - 0.5	-	0.8	V
V _{OH}	Output HIGH voltage	I _{OUT} = -2 mA	2.4	-	-	V
V _{OL}	Output LOW voltage	I _{OUT} = 4 mA	-	-	0.4	V
V _{CAP}	Storage capacitor	Between V _{CAP} pin and V _{SS} , 5 V rated	61	68	180	μF

Notes

- 12. Typical values are at 25°C, V_{CC}= V_{CC} (Typ). Not 100% tested.
- 13. The HSB pin has I_{OUT} = -2 uA for V_{OH} of 2.4 V when both active HIGH and LOW drivers are disabled. When they are enabled standard V_{OH} and V_{OL} are valid. This parameter is characterized but not tested.

Data Retention and Endurance

Parameter	Description	Min	Unit
DATA _R	Data retention	20	Years
NV _C	Nonvolatile STORE operations	1,000	K

Capacitance

In the following table, the capacitance parameters are listed.^[14]

Parameter	Description	Test Conditions	Max	Unit
C _{IN}	Input capacitance (except BHE, BLE and HSB)	T _A = 25 °C, f = 1 MHz, V _{CC} = V _{CC} (Typ)	7	pF
	Input capacitance (for BHE, BLE and HSB)		8	pF
C _{OUT}	Output capacitance (except HSB)		7	pF
	Output capacitance (for HSB)		8	pF

Thermal Resistance

In the following table, the thermal resistance parameters are listed.^[14]

Parameter	Description	Test Conditions	48-FBGA	44-TSOP II	54-TSOP II	Unit
Θ _{JA}	Thermal resistance (Junction to ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	28.82	31.11	30.73	°C/W
Θ _{JC}	Thermal resistance (Junction to case)		7.84	5.56	6.08	°C/W

Figure 5. AC Test Loads

AC Test Conditions

- Input pulse levels.....0 V to 3 V
- Input rise and fall times (10% - 90%) ≤3 ns
- Input and output timing reference levels 1.5 V

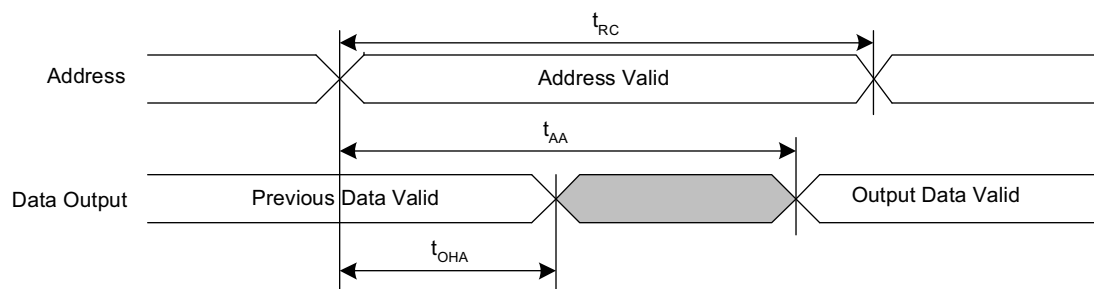

Note
14. These parameters are guaranteed by design but not tested.

$t_{HZWE}^{[17, 18, 19]}$	t_{WZ}	Write enable to output disable	–	8	–	10	–	15	ns
$t_{LZWE}^{[17, 18]}$	t_{OW}	Output active after end of write	3	–	3	–	3	–	ns
t_{BW}	–	Byte enable to end of write	15	–	20	–	30	–	ns

Switching Waveforms

Figure 6. SRAM Read Cycle #1: Address Controlled^[15, 16, 20]

Notes

15. \overline{WE} must be HIGH during SRAM read cycles.
16. Device is continuously selected with \overline{CE} , \overline{OE} and $\overline{BHE} / \overline{BLE}$ LOW.
17. These parameters are guaranteed by design but not tested.
18. Measured ± 200 mV from steady state output voltage.
19. If \overline{WE} is LOW when \overline{CE} goes LOW, the outputs remain in the high impedance state.
20. \overline{HSB} must remain HIGH during read and write cycles.

Figure 7. SRAM Read Cycle #2: \overline{CE} and \overline{OE} Controlled^[21, 22, 23]

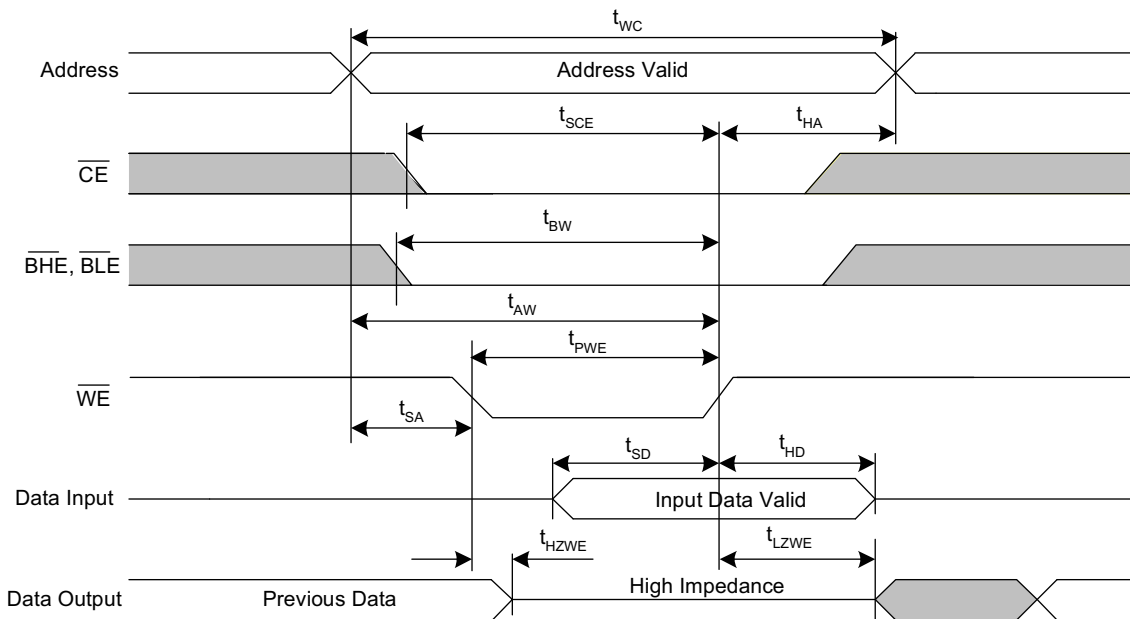

Figure 8. SRAM Write Cycle #1: \overline{WE} Controlled^[21, 23, 24, 25]

Notes

- 21. BHE and BLE are applicable for ×16 configuration only.
- 22. \overline{WE} must be HIGH during SRAM read cycles.
- 23. HSB must remain HIGH during read and write cycles.
- 24. If \overline{WE} is LOW when \overline{CE} goes LOW, the outputs remain in the high impedance state.
- 25. \overline{CE} or \overline{WE} must be $\geq V_{IH}$ during address transitions.

Figure 9. SRAM Write Cycle #2: $\overline{\text{CE}}$ Controlled^[26, 27, 28, 29]

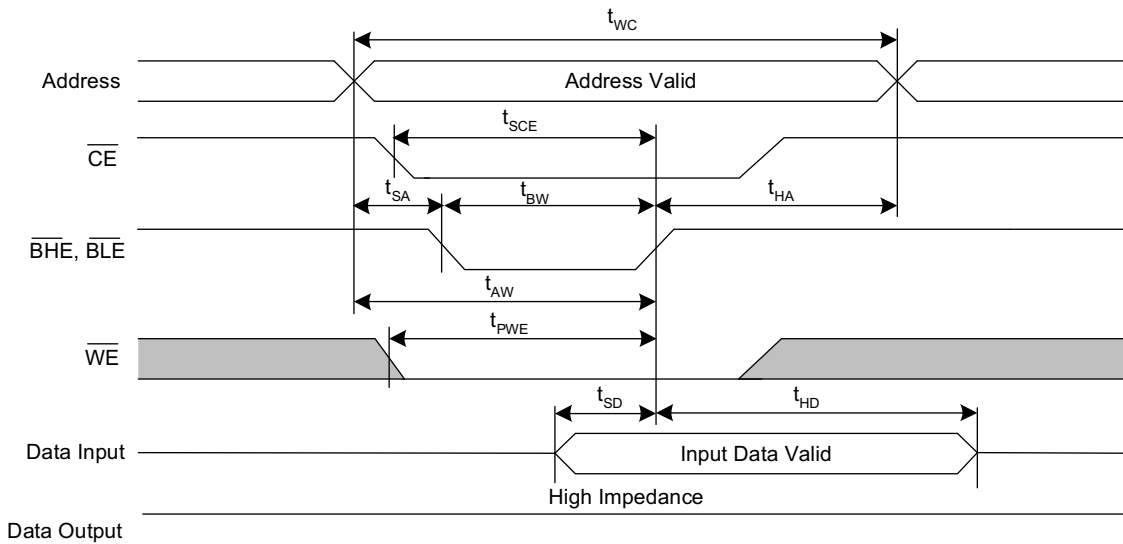

Figure 10. SRAM Write Cycle #3: $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ Controlled^[26, 27, 28, 29]

Notes

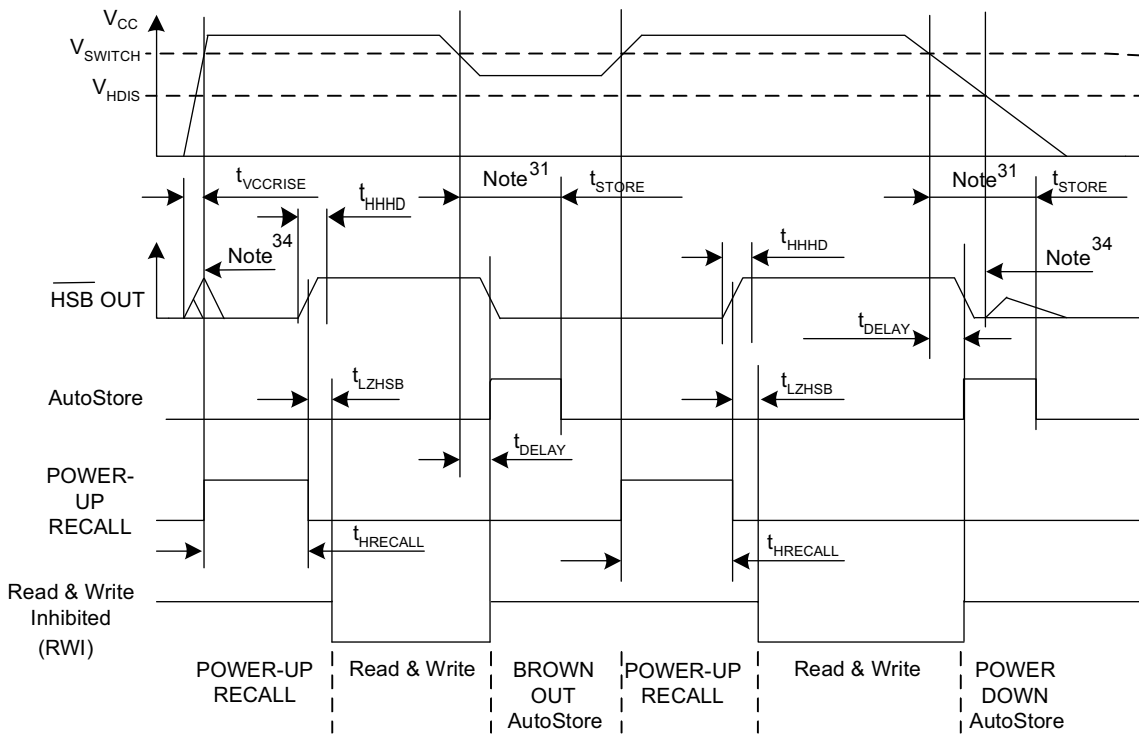

- 26. $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ are applicable for $\times 16$ configuration only.
- 27. If $\overline{\text{WE}}$ is LOW when $\overline{\text{CE}}$ goes LOW, the outputs remain in the high impedance state.
- 28. $\overline{\text{HSB}}$ must remain HIGH during read and write cycles.
- 29. $\overline{\text{CE}}$ or $\overline{\text{WE}}$ must be $\geq V_{\text{IH}}$ during address transitions.

AutoStore/Power-Up RECALL

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
$t_{HRECALL}^{[30]}$	Power-Up RECALL duration	-	20	-	20	-	20	ms
$t_{STORE}^{[31]}$	STORE cycle duration	-	8	-	8	-	8	ms
$t_{DELAY}^{[32]}$	Time allowed to complete SRAM write cycle	-	20	-	25	-	25	ns
V_{SWITCH}	Low voltage trigger level	-	2.65	-	2.65	-	2.65	V
$t_{VCCRRISE}^{[14]}$	V_{CC} rise time	150	-	150	-	150	-	μ s
$V_{HDIS}^{[14]}$	HSB output disable voltage	-	1.9	-	1.9	-	1.9	V
$t_{LZHSB}^{[14]}$	HSB to output active time	-	5	-	5	-	5	μ s
$t_{HHHD}^{[14]}$	HSB high active time	-	500	-	500	-	500	ns

Switching Waveforms

Figure 11. AutoStore or Power-Up RECALL^[33]

Notes

- 30. $t_{HRECALL}$ starts from the time V_{CC} rises above V_{SWITCH} .
- 31. If an SRAM write has not taken place since the last nonvolatile cycle, no AutoStore or Hardware STORE takes place.
- 32. On a Hardware STORE and AutoStore initiation, SRAM write operation continues to be enabled for time t_{DELAY} .
- 33. Read and write cycles are ignored during STORE, RECALL, and while V_{CC} is below V_{SWITCH} .
- 34. During power-up and power-down, HSB glitches when HSB pin is pulled up through an external resistor.

Software Controlled STORE/RECALL Cycle

In the following table, the software controlled STORE and RECALL cycle parameters are listed.^[35, 36]

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
t_{RC}	STORE/RECALL initiation cycle time	20	–	25	–	45	–	ns
t_{SA}	Address setup time	0	–	0	–	0	–	ns
t_{CW}	Clock pulse width	15	–	20	–	30	–	ns
t_{HA}	Address hold time	0	–	0	–	0	–	ns
t_{RECALL}	RECALL duration	–	200	–	200	–	200	μ s

Switching Waveforms

Figure 12. \overline{CE} and \overline{OE} Controlled Software STORE/RECALL Cycle^[36]

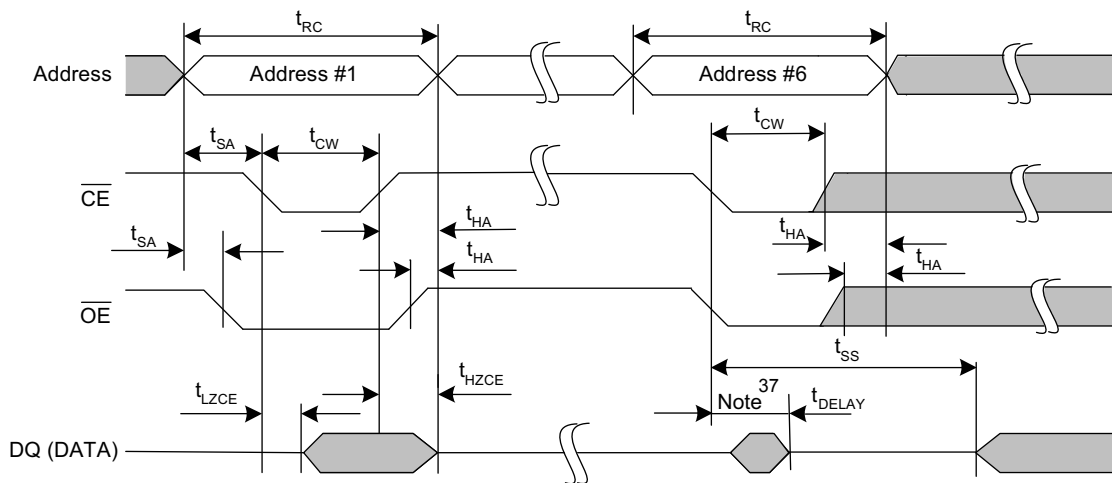

Figure 13. AutoStore Enable/Disable Cycle

Notes

- 35. The software sequence is clocked with \overline{CE} controlled or \overline{OE} controlled reads.
- 36. The six consecutive addresses must be read in the order listed in Table 2 on page 6. \overline{WE} must be HIGH during all six consecutive cycles.
- 37. DQ output data at the sixth read may be invalid since the output is disabled at t_{DELAY} time.

Hardware STORE Cycle

Parameter	Description	20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	
t_{DHSB}	HSB to output active time when write latch not set	–	20	–	25	–	25	ns
t_{PHSB}	Hardware STORE pulse width	15	–	15	–	15	–	ns
t_{SS} [38, 39]	Soft sequence processing time	–	100	–	100	–	100	μ s

Switching Waveforms

Figure 14. Hardware STORE Cycle^[40]

Figure 15. Soft Sequence Processing^[38, 39]

Notes

- 38. This is the amount of time it takes to take action on a soft sequence command. Vcc power must remain HIGH to effectively register command.
- 39. Commands such as STORE and RECALL lock out I/O until operation is complete which further increases this time. See the specific command.
- 40. If an SRAM write has not taken place since the last nonvolatile cycle, no AutoStore or Hardware STORE takes place.

Truth Table For SRAM Operations

HSB should remain HIGH for SRAM Operations.

For x8 Configuration

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	Inputs/Outputs ^[41]	Mode	Power
H	X	X	High-Z	Deselect/Power-down	Standby
L	H	L	Data out (DQ ₀ –DQ ₇);	Read	Active
L	H	H	High-Z	Output disabled	Active
L	L	X	Data in (DQ ₀ –DQ ₇);	Write	Active

For x16 Configuration

$\overline{\text{CE}}$	$\overline{\text{WE}}$	$\overline{\text{OE}}$	$\overline{\text{BHE}}$ ^[42]	$\overline{\text{BLE}}$ ^[42]	Inputs/Outputs ^[41]	Mode	Power
H	X	X	X	X	High-Z	Deselect/Power-down	Standby
L	X	X	H	H	High-Z	Output disabled	Active
L	H	L	L	L	Data out (DQ ₀ –DQ ₁₅)	Read	Active
L	H	L	H	L	Data out (DQ ₀ –DQ ₇); DQ ₈ –DQ ₁₅ in High Z	Read	Active
L	H	L	L	H	Data out (DQ ₈ –DQ ₁₅); DQ ₀ –DQ ₇ in High Z	Read	Active
L	H	H	L	L	High-Z	Output disabled	Active
L	H	H	H	L	High-Z	Output disabled	Active
L	H	H	L	H	High-Z	Output disabled	Active
L	L	X	L	L	Data in (DQ ₀ –DQ ₁₅)	Write	Active
L	L	X	H	L	Data in (DQ ₀ –DQ ₇); DQ ₈ –DQ ₁₅ in High Z	Write	Active
L	L	X	L	H	Data in (DQ ₈ –DQ ₁₅); DQ ₀ –DQ ₇ in High Z	Write	Active

Notes

41. Data DQ₀–DQ₇ for x8 configuration and Data DQ₀–DQ₁₅ for x16 configuration.

42. BHE and BLE are applicable for x16 configuration only.
