

2M x 8 Static RAM

Features

- High speed
 - $t_{AA} = 8, 10, 12 \text{ ns}$
- Low active power
 - 1080 mW (max.)
- Operating voltages of $3.3 \pm 0.3V$
- 2.0V data retention
- Automatic power-down when deselected
- TTL-compatible inputs and outputs
- Easy memory expansion with \overline{CE}_1 and \overline{CE}_2 features

Functional Description

The CY7C1069AV33 is a high-performance CMOS Static RAM organized as 2,097,152 words by 8 bits. Writing to the

device is accomplished by enabling the chip (by taking \overline{CE}_1 LOW and \overline{CE}_2 HIGH) and Write Enable (\overline{WE}) inputs LOW.

Reading from the device is accomplished by enabling the chip (\overline{CE}_1 LOW and \overline{CE}_2 HIGH) as well as forcing the Output Enable (\overline{OE}) LOW while forcing the Write Enable (\overline{WE}) HIGH. See the truth table at the back of this data sheet for a complete description of Read and Write modes.

The input/output pins (I/O_0 through I/O_7) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a Write operation (\overline{CE}_1 LOW, \overline{CE}_2 HIGH, and \overline{WE} LOW).

The CY7C1069AV33 is available in a 54-pin TSOP II package with center power and ground (revolutionary) pinout, and a 48-ball fine-pitch ball grid array (FBGA) package.

Notes:

- Valid SRAM operation does not occur until the power supplies have reached the minimum operating V_{DD} (3.0V). As soon as 1ms (T_{power}) after reaching the minimum operating V_{DD} , normal SRAM operation can begin including reduction in V_{DD} to the data retention (V_{CCDR} , 2.0V) voltage.
- Test conditions assume signal transition time of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and transmission line loads. Test conditions for the Read cycle use output loading shown in part a) of the AC test loads, unless specified otherwise.
- This part has a voltage regulator which steps down the voltage from 3V to 2V internally. t_{power} time has to be provided initially before a Read/Write operation is started.
- t_{HZOE} , t_{HZSCE} , t_{HZWE} and t_{LZOE} , t_{LZCE} , and t_{LZWE} are specified with a load capacitance of 5 pF as in (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
- These parameters are guaranteed by design and are not tested.
- The internal Write time of the memory is defined by the overlap of \overline{CE}_1 LOW / CE_2 HIGH, and \overline{WE} LOW. \overline{CE}_1 and \overline{WE} must be LOW along with CE_2 HIGH to initiate a Write, and the transition of any of these signals can terminate the Write. The input data set-up and hold timing should be referenced to the leading edge of the signal that terminates the Write.
- The minimum Write cycle time for Write Cycle No. 3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .

Notes:

10. Device is continuously selected. $\overline{CE}_1 = V_{IL}$, $CE_2 = V_{IH}$.
11. \overline{WE} is HIGH for Read cycle.

L	H	X	L	Data In	Write All Bits	Active (I_{CC})
L	H	H	H	High-Z	Selected, Outputs Disabled	Active (I_{CC})

Notes:

12. Address valid prior to or coincident with \overline{CE}_1 transition LOW and \overline{CE}_2 transition HIGH.
13. Data I/O is high-impedance if $\overline{OE} = V_{IH}$.
14. If \overline{CE}_1 goes HIGH / \overline{CE}_2 LOW simultaneously with \overline{WE} going HIGH, the output remains in a high-impedance state.
15. \overline{CE} above is defined as a combination of \overline{CE}_1 and \overline{CE}_2 . It is active low.
