## Full Frame CCD Image Sensor

FTF3020-M

- 35mm film compatible image format (36 x 24 mm²)
- 6M active pixels (3072H x 2048V)
- Progressive scan
- · Excellent anti-blooming
- · Variable electronic shuttering
- · Square pixel structure
- · H and V binning
- 100% optical fill factor
- High linear dynamic range (>72dB)
- High sensitivity
- · Low dark current and fixed-pattern noise
- · Low read-out noise
- Data rate up to 36 MHz
- · Mirrored, split and four quadrant read-out
- · Perfectly matched to visual spectrum

#### Description

The FTF3020-M is a full frame CCD monochrome image sensor designed for professional digital photography applications, with very low dark current and a linear dynamic range of over 12 true bits at room temperature. The four low-noise output amplifiers, one at each corner of the chip, make the FTF3020-M suitable for a wide range of high-end visual light applications. With one output amplifier, a progressively scanned image can be read out at 5 frames per second. By using multiple outputs the frame rate increases accordingly. The device structure is shown in figure 1.

Figure 1 - Device structure

## Full Frame CCD Image Sensor

FTF3020-M

#### Architecture of the FTF3020-M

The optical centres of all pixels in the image section form a square grid. The charge is generated and integrated in this section. Output registers are located below and above the image section for read-out. After the integration time, the image charge is shifted one line at the time to either the upper or lower register or to both simultaneously, depending on the read-out mode. The left and the right half of each register can be controlled independently. This

enables either single or multiple read-out. During vertical transport, the C3 gates separate the pixels in the register. The central C3 gates of the lower and upper registers are part of the left half of the sensor (W and Z quadrants respectively). Each register can be used for vertical binning. Each register contains a summing gate at both ends that can be used for horizontal binning (see figure 2).

|   | IMAGE SECTION                   |
|---|---------------------------------|
|   |                                 |

<sup>&</sup>lt;sup>1</sup> During Charge Reset it is allowed to exceed maximum rating levels (see note <sup>5</sup>).

<sup>&</sup>lt;sup>2</sup> All voltages in relation to SFS.

<sup>&</sup>lt;sup>3</sup> To set the VNS voltage for optimal Vertical Anti-Blooming (VAB), it should be adjustable between minimum and maximum values.

<sup>&</sup>lt;sup>4</sup>Three-level clock is preferred for maximum charge; the swing during vertical transport should be 4V higher than the voltage during integration. A two level clock (typically 10V) can be used if a lower maximum charge handling capacity is allowed.

<sup>&</sup>lt;sup>5</sup> Charge Reset can be achieved in two ways:

<sup>•</sup> The typical A-clock low level is applied to all image clocks; for proper CR, an additional Charge Reset pulse on VNS is required (preferred).

<sup>•</sup> The typical CR level is applied to all image clocks simultaneously.

#### **Performance**

The test conditions for the performance characteristics are as follows:

- All values are measured using typical operating conditions.
- VNS is adjusted as low as possible while maintaining proper Vertical Anti-Blooming.
- Sensor temperature = 60°C (333K).
- Horizontal transport frequency = 18MHz.
- Vertical transport frequency = 50kHz (unless specified otherwise).
- Integration time = 10ms (unless specified otherwise).
- The light source is a lamp of 3200K in conjunction with neutral density filters and a 1.7mm thick BG40 infrared cut-off filter. For Linear Operation measurements, a temperature conversion filter (Melles Griot type no. 03FCG261, -120 mired, thickness: 2.5mm) is applied.

| LINEAR OPERATION                                   | MIN.          | TYPICAL  | MAX. | UNIT      |
|--|---------------|----------|------|-----------|
| Linear dynamic range <sup>1</sup>                  | 4200:1(12bit) |          |      |           |

## Full Frame CCD Image Sensor

FTF3020-M

#### **Application information**

#### Current handling

One of the purposes of VPS is to drain the holes that are generated during exposure of the sensor to light. Free electrons are either transported to the VRD connection and, if excessive (from overexposure), free electrons are drained to VNS. No current should flow into any VPS connection of the sensor. During high overexposure a total current 10 to 15mA through all VPS connections together may be expected. The PNP emitter follower in the circuit diagram (figure 11) serves these current requirements.

VNS drains superfluous electrons as a result of overexposure. In other words, it only sinks current. During high overexposure a total current of 10 to 15mA through all VNS connections together may be expected. The NPN emitter follower in the circuit diagram meets these current requirements. The clamp circuit, consisting of the diode and electrolytic capacitor, enables the addition of a Charge Reset (CR) pulse on top of an otherwise stable VNS voltage. To protect the CCD, the current resulting from this pulse should be limited. This can be accomplished by designing a pulse generator with a rather high output impedance.

#### Decoupling of DC voltages

All DC voltages (not VNS, which has additional CR pulses as described above) should be decoupled with a 100nF decoupling capacitor. This capacitor must be mounted as close as possible to the sensor pin. Further noise reduction (by bandwidth limiting) is achieved by the resistors in the connections between the sensor and its voltage supplies. The electrons that build up the charge packets that will reach the floating diffusions only add up to a small current, which will flow through VRD. Therefore a large series resistor in the VRD connection may be used.

#### Outputs

To limit the on-chip power dissipation, the output buffers are designed with open source outputs. Outputs to be used should therefore be loaded with a current source or more simply with a resistance to GND. In order to prevent the output (which typically has an output impedance of about  $400\Omega)$  from bandwidth limitation as a result of capacitive loading, load the output with an emitter follower built from a high-frequency transistor. Mount the base of this transistor as close as possible to the sensor and keep the connection between the

emitter and the next stage short. The CCD output buffer can easily be destroyed by ESD. By using this emitter follower, this danger is suppressed; do NOT reintroduce this danger by measuring directly on the output pin of the sensor with an oscilloscope probe. Instead, measure on the output of the emitter follower. Slew rate limitation is avoided by avoiding a too-small quiescent current in the emitter follower; about 10mA should do the job. The collector of the emitter follower should be decoupled properly to suppress the Miller effect from the base-collector capacitance.

A CCD output load resistor of  $3.3k\Omega$  typically results in a bandwidth of 110MHz. The bandwidth can be enlarged to about 130MHz by using a resistor of  $2.2k\Omega$  instead, which, however, also enlarges the on-chip power dissipation.

#### Device protection

The output buffers of the FTF3020-M are likely to be damaged if VPS rises above SFD or RD at any time. This danger is most realistic during power-on or power-off of the camera. The RD voltage should always be lower than the SFD voltage.

Never exceed the maximum output current. This may damage the device permanently. The maximum output current should be limited to 10mA.

Be especially aware that the output buffers of these image sensors are very sensitive to ESD damage.

Because of the fact that our CCDs are built on an n-type substrate, we are dealing with some parasitic npn transistors. To avoid activation of these transistors during switch-on and switch-off of the camera, we recommend the application diagram of figure 11.

#### Unused sections

To reduce power consumption the following steps can be taken. Connect unused output register pins (C1...C3, SG, OG) and unused SFS pins to zero Volts.

#### More information

Detailed application information is provided in the application note AN01 entitled 'Camera Electronics for the mK x nK CCD Image Sensor Family'.

## Full Frame CCD Image Sensor

FTF3020-M

#### **Device Handling**

An image sensor is a MOS device which can be destroyed by electrostatic discharge (ESD). Therefore, the device should be handled with care.

Always store the device with short-circuiting clamps or on conductive foam. Always switch off all electric signals when inserting or removing the sensor into or from a camera (the ESD protection in the CCD image sensor process is less effective than the ESD protection of standard CMOS circuits).

Being a high quality optical device, it is important that the cover glass remain undamaged. When handling the sensor, use fingercots.

When cleaning the glass we recommend using ethanol (or possibly water). Use of other liquids is strongly discouraged:

- if the cleaning liquid evaporates too quickly, rubbing is likely to cause ESD damage.
- the cover glass and its coating can be damaged by other liquids.

Rub the window carefully and slowly.

Dry rubbing of the window may cause electro-static charges or scratches which can destroy the device.

## Full Frame CCD Image Sensor

FTF3020-M

### Pin configuration

The FTF3020-M is mounted in a Pin Grid Array (PGA) package with 96 pins in a 20x15 grid of  $52.70 \times 40.00$  mm<sup>2</sup>. The position of pin A1 (quadrant W) is marked with a gold dot on top of the package.

The image clock phases of quadrant W are internally connected to X, and Y is connected to Z.

| Symbol | Name                     | Pin # W | Pin # X | Pin # Y | Pin # Z |

## Full Frame CCD Image Sensor

FTF3020-M

#### Package information

Figure 13 - Mechanical drawing of the PGA package of the FTF3020-M

#### **Order codes**

The sensors can be ordered using the following codes:

| FTF3020-M sensors                    |                  |                |  |  |  |  |
|--------------------------------------|------------------|----------------|--|--|--|--|
| Description Quality Grade Order Code |                  |                |  |  |  |  |
| FTF3020-M/TG                         | Test grade       | 9922 157 31431 |  |  |  |  |
| FTF3020-M/EG                         | Economy grade    | 9922 157 31451 |  |  |  |  |
| FTF3020-M/IG                         | Industrial grade | 9922 157 31421 |  |  |  |  |
| FTF3020-M/HG                         | High grade       | 9922 157 31411 |  |  |  |  |
