

## KMT32B

### Magnetic Angle Sensor

#### SPECIFICATIONS

- AMR Sensor with 180° period
- high accuracy
- high resolution
- for the use at moderate field strengths
- tiny TDFN package
- ROHS & REACH compliant

The KMT32B is a magnetic field sensor based on the anisotropic magneto resistance effect, i.e. it is sensing the **magnetic field direction** independently on the magnetic field strength for applied field strengths  $H > 25$  kA/m. The sensor contains two parallel supplied Wheatstone bridges, which enclose a sensitive angle of 45 degrees.

#### FEATURES

- Contactless angular position, ideal for harsh environments
- Design optimized for linearity
- High accuracy
- Low cost, low power
- Self diagnosis feature
- Attractive SMD packages
- User has complete control over signal evaluation
- Extended operating temperature range (-40 °C to +150 °C, +160°C on request)
- REACH & RoHS compliant (lead free)

A rotating magnetic field in the surface parallel to the chip (x-y plane) will therefore deliver two independent sinusoidal output signals, one following a  $\cos(2\alpha)$  and the second following a  $\sin(2\alpha)$  function,  $\alpha$  being the angle between sensor and field direction (see Figure 2).

The KMT32B magnetic field sensor is suited for high precision angle measurement applications at a regular field strength of  $H_0 \geq 25$  kA/m (generated for example with magnet 67.044 from Magnetfabrik Bonn at a distance of 5.2 mm at room temperature). With reduced accuracy, the sensor KMT32B may be used with a field strength of  $H_0 \geq 14$  kA/m (at room temperature; be aware of the influence of the earth magnetic field!). Most magnets show a decreasing field strength with temperature while the magnetic field direction is unchanged.

## APPLICATIONS

- Absolute and incremental angle measurement
- Automotive (steering angle, torque)
- Robotics
- Camera positioning
- Potentiometer replacement
- Position measurement in medical applications
- Motor motion control

Stress above one or more of the limiting values may cause permanent damage to the device. Exposure to limiting values for extended periods may affect device reliability.

## MEASUREMENT CONDITIONS

Parameter	Symbol	Unit	Condition
<b>Condition A: Set Up Conditions</b>			
Ambient temperature	T	°C	T = 25 °C (unless otherwise noted)
Supply voltage	$V_{CC}$	V	$V_{CC} = 5 V$
Applied magnetic field	H	kA/m	H = 25 kA/m

<b>Condition B: Sensor Specifications (360° turn , Vo<sub>max</sub>&gt;0, Vo<sub>min</sub>&lt;0)</b>			
Output signal amplitude	V <sub>PEAK</sub>	mV/V	$V_{PEAK} = (V_{Omax} - V_{Omin})/2/V_{CC}$
Offset voltage	V <sub>OFF</sub>	mV/V	$V_{OFF} = (V_{Omax} + V_{Omin})/2/V_{CC}$
Angular inaccuracy	Δα	deg	$\Delta\alpha = MAX \alpha_0 - \alpha $ ; max. angular difference between actual field angle α <sub>0</sub> and measured angle α due to deviations from ideal sinusoidal characteristics, calculated from the third and fifth harmonics of the Fourier spectrum; offset voltage error contributions not included
Angular hysteresis	ΔαH	deg	$\Delta\alpha H =  \alpha_{left\ turn} - \alpha_{right\ turn} $ angular difference between left and right turn
