## **Dual Retriggerable Monostable Multivibrators**

REJ03D0314-0600Z (Previous ADE-205-258D (Z)) Rev.6.00 Jun. 02, 2004

## **Description**

The HD74LV123A features output pulse-duration control by three methods. In the first method, the A input is low and the B input goes high. In the second method, the B input is high and the  $\overline{A}$  input goes low. In the third method, the  $\overline{A}$  input is low, the B input is high, and the clear ( $\overline{CLR}$ ) input goes high.

The basic pulse duration is programmed by selecting external resistance and capacitance values.

The external timing capacitor must be connected between Cext and Rext/Cext (positive) and an external resistor connected between Rext/Cext and Vcc

To obtain variable pulse durations, connect an external variable resistance between Rext/Cext and Vcc.

Once triggered, the basic pulse duration can be extended by retriggering the gated low-level-active  $(\overline{A})$  or high-level-active (B) input. Pulse duration can be reduced by taking  $\overline{CLR}$  low.

#### **Features**

- $V_{CC} = 2.0 \text{ V to } 5.5 \text{ V operation}$
- All inputs  $V_{IH}$  (Max.) = 5.5 V (@ $V_{CC}$  = 0 V to 5.5 V)
- All outputs  $V_0$  (Max.) = 5.5 V (@ $V_{CC} = 0$  V)
- Output current  $\pm 6$  mA (@V<sub>CC</sub> = 3.0 V to 3.6 V),  $\pm 12$  mA (@V<sub>CC</sub> = 4.5 V to 5.5 V)

Maximum power dissipation at	P <sub>T</sub>	785	mW	SOP
Ta = 25°C (in still air)*3		500		TSSOP
Storage temperature	Tstg	-65 to 150	°C	

Notes: The absolute maximum ratings are values, which must not individually be exceeded, and furthermore, no two of which may be realized at the same time.

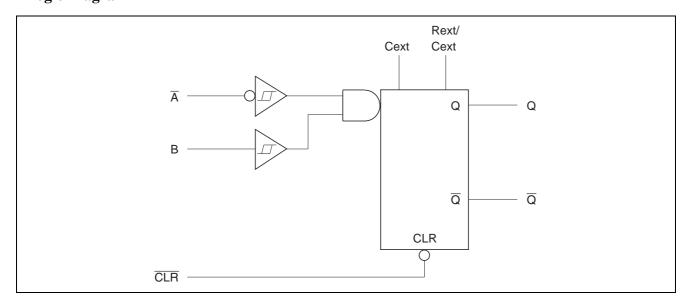

- 1. The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- 2. This value is limited to 5.5 V maximum.
- 3. The maximum package power dissipation was calculated using a junction temperature of 150°C.

#### Caution in use

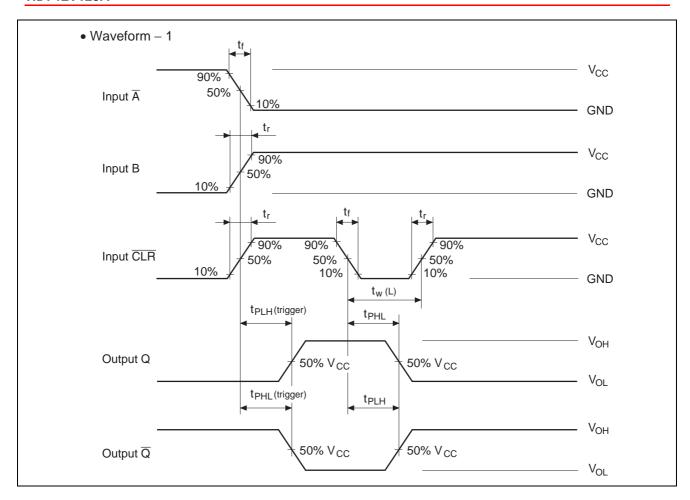

In order to prevent any malfunctions due to noise, connect a high frequency performance capacitor between Vcc and GND, and keep the wiring between the External components and Cext, Rext/Cext pins as short as possible.

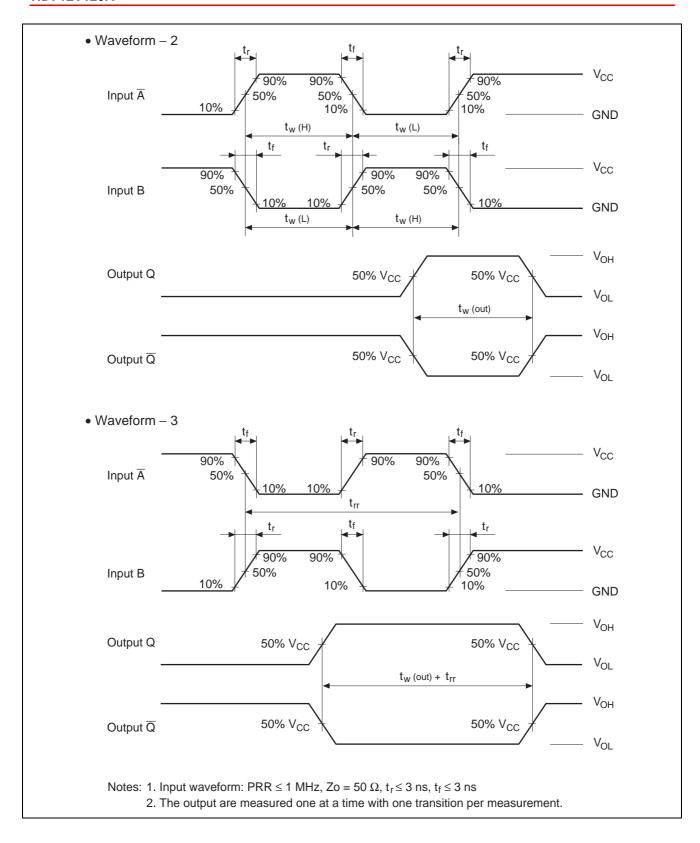

Large values of Cext may cause problems when powering down the HD74LV123A because of the amount of energy stored in the capacitor. When a system containing this device is powered down, the capacitor may discharge from Vcc through the protection diodes at pin 7 or pin 15.

Current through the input protection diodes must be limited to 20 mA; therefore, the turn-off time of the Vcc power supply must not be faster than  $t = Vcc \bullet Cext/(20 \text{ mA})$ . For example, if Vcc = 5 V and Cext = 22  $\mu$ F, the Vcc supply must turn off no faster than  $t = (5 \text{ V}) \bullet (22 \mu\text{F})/20 \text{ mA} = 5.5 \text{ ms}$ . This is usually not a problem because power supplies are heavily filtered and cannot discharge at this rate.

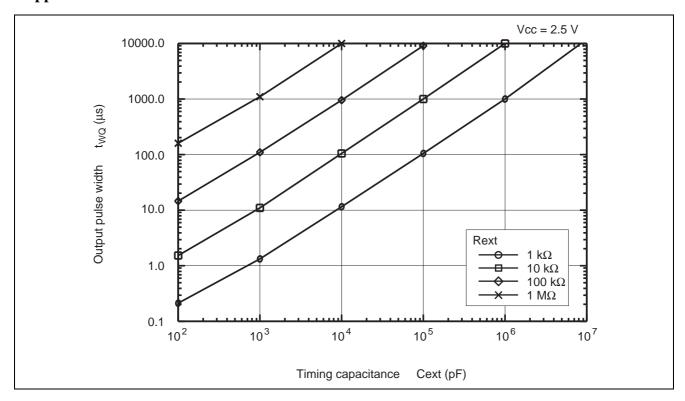

When a more rapid decrease of Vcc to zero volts occurs, the HD74LV123A may sustain damage. To avoid this possibility, use an external calmping diode.

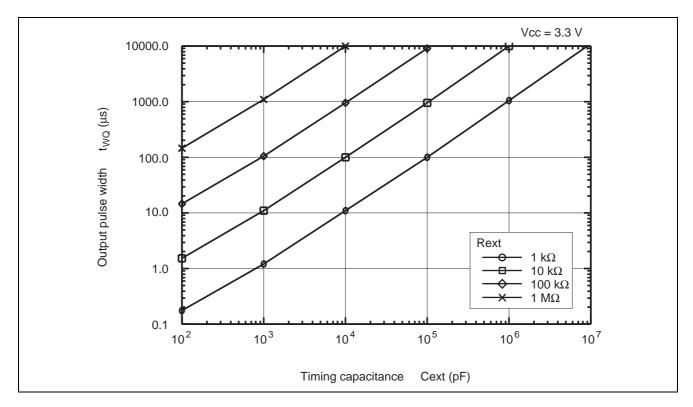

The input pins for unused circuit should be used under conditions to fix the outputs to avoid malfunction cased by noises. Also, it's recommended that Rext / Cext terminals are open and external parts are not connected to.
