### General Description

The HMC314 is a GaAs InGaP Heterojunction Bipolar Transistor (HBT) MMIC amplifier that operates from a single positive supply. This amplifier also incorporates a power down feature. When the "Vpd" pin is held low, the amplifier will shut down. The surface mount SOT26 amplifier can be used as a broadband gain stage for wideband applications. The amplifier provides 12 dB of gain and +22 dBm of saturated power while operating from a single positive +5v supply. The HMC314 is packaged in an ultra small SOT26 package at a height of only 1.45mm.

The circuit board used in the final application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
