

64-Channel Serial to Parallel Converter With High Voltage Push-Pull Outputs

Features

- ▶ Processed with HVCMOS® technology
- ▶ Output voltages to 180V
- ▶ Low power level shifting
- ▶ Shift register speed:
 - 6.0MHz @ $V_{DD} = 5.0V$
 - 12MHz @ $V_{DD} = 12V$
- ▶ Latched data outputs
- ▶ Output polarity and blanking
- ▶ CMOS compatible inputs
- ▶ Forward and reverse shifting options

General Description

The HV3418 is a low voltage serial to high voltage parallel converter with push-pull outputs. This device has been designed for use as a printer driver for inkjet applications. It can also be used in any application requiring multiple output, high voltage, low current sourcing and sinking capabilities.

The device consists of a 64-bit shift register, 64 latches, and control logic to perform the polarity select and blanking of the outputs. A DIR pin controls the direction of data shift through the device. With DIR grounded, D_{IOA} is Data-In and D_{IOB} is Data-Out; data is shifted from HV_{OUT64} to HV_{OUT1} . When DIR is at logic high, D_{IOB} is Data-In and D_{IOA} is Data-Out; data is then shifted from HV_{OUT1} to HV_{OUT64} . Data is shifted through the shift register on the low to high transition of the clock. Data output buffers are provided for cascading devices. Operation of the shift register is not affected by the LE (latch enable), BL (blanking), or the POL (polarity) inputs. Transfer of data from the shift register to the latch occurs when the LE (latch enable) is high. The data in the latch is stored during LE transition from high to low.

Absolute Maximum Ratings

Parameter	Value
Supply voltage, V_{DD}	-0.5V to +15V
Output voltage, V_{PP}	V_{DD} to +200V
Logic input levels	-0.5V to V_{DD} +0.5V
Ground current ¹	1.5A
High voltage supply current ¹	1.3A
Continuous total power dissipation ²	1200mW
Operating temperature range	-40°C to +85°C
Storage temperature range	-65°C to +150°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to GND.

Notes:

1. Connection to all power and ground pads is required. Duty cycle is limited by the total power dissipated in the package.
2. For operation above 25°C ambient derate linearly to maximum operating temperature at 20mW/°C.

Recommended Operating Conditions

Sym	Parameter	Min	Typ	Max	Units	
V_{DD}	Logic supply voltage	$V_{DD} = 5.0V$	4.5	5.0	5.5	V
		$V_{DD} = 12V$	10.8	12.0	13.2	
V_{PP}	High voltage supply	60	-	180	V	
V_{IH}	High-level input voltage	$V_{DD} - 0.9$	-	V_{DD}	V	
V_{IL}	Low-level input voltage	0	-	0.9	V	
T_A	Operating free-air temperature	-40	-	+85	°C	

Power-up sequence should be the following:

1. Connect ground
2. Apply V_{DD}
3. Set all inputs (Data, CLK, Enable, etc.) to a known state
4. Apply V_{PP}

The V_{PP} should not drop below V_{DD} or float during operation.

Power-down sequence should be the reverse of the above.

t_{DLH}	Delay time clock to data low to high	-	75 (160)	ns	$C_L = 20\text{pF}$
t_R, t_F	All logic inputs	-	5.0	ns	---

Notes:

- Shift register speed can be as low as DC as long as data set-up and hold time meet the spec.
- AC characteristics are guaranteed only under $V_{DD} = 12\text{V}$ and $V_{DD} = 5.0\text{V}$.
