![Power-One™ — Changing the Shape of Power]

Features

- 75 Watts total output power
- Wide input range 18V – 60V
- Independent dual outputs
- Flexible load sharing
- Open-frame design with IMS board
- Low profile – 12.7mm height
- Start-up into high capacitive load
- Output overcurrent protection (self restart)
- Output overvoltage protection (self restart)
- Overtemperature protection (self restart)
- Setpoint accuracy ± 2.0%
- Output voltage trim adjust, independent for each output
- Input/output isolation: 1500V
- UL 1950 Recognition, CSA 22.2 No. 950-95 certification

Applications

- Distributed power architectures
- Telecommunications equipment
- LAN/WAN applications
- Data processing applications

Description

The HWD series provides onboard conversion of standard telecom and datacom input voltages into two isolated low-voltage outputs. These products offer a unique combination of wide input range, low profile, and high current capability. High efficiency and advanced thermal management enable these half-brick products to deliver full rated power at 55°C ambient temperature, with 200 LFM airflow, without the addition of heatsinks.

Model Selection						
Model	**Input Voltage Range, VDC**	**Input Current, Max, ADC**	**Output Voltage, VDC**	**Output Rated Current, ADC**	**Output Ripple and Noise, mV p-p**	**Efficiency %**

NUCLEAR AND MEDICAL APPLICATIONS - Power-One products are not authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

REV. JUN 27, 2003

Table 1. Absolute Maximum Ratings

Parameter	Symbol	Min	Max	Units
Input Voltage Continuous Transient (100 msec)	Vi Vi	- -	60 100	VDC VDC
Operating Baseplate Temperature Note 1	Tb	-40	+100	°C
Storage Temperature	Tstg	-55	+125	°C
Input to Output Isolation	-	-	1500	VDC
Output Short Circuit Duration	-	-	Continuous	-
Total Output Power	$P_o$max	-	75	W
No Load Power Dissipation		-	6	W

Electrical Specifications

Unless otherwise indicated, specifications apply over all input voltages, resistive load, and Tbp=+40°C.

Table 2. Input Specifications

Parameter	Symbol	Min	Typ	Max	Units
Voltage Range	Vi	18*	24/48	60	VDC
Maximum Input Current	Ii	-	-	5.5	A
Input Ripple Rejection (120 Hz)		-	60	-	dB
Inrush Transient		-	-	1	A^2s
Input Reflected Ripple (see figure 1)		-	-	250	mA p-p

- Module will operate within specification with an input voltage of 18 VDC, but must be turned on with an input voltage > 19.5 VDC. See Undervoltage Lockout Specification.

Fusing Considerations

<u>CAUTION</u>

This DC-DC converter is not internally fused. An external input fuse must always be used.

FEATURE DESCRIPTIONS

Output Overvoltage Clamp

The output overvoltage clamp consists of a separate control loop, independent of the primary control loop. This control loop has a higher voltage setpoint than the primary loop. In a fault condition the converter goes into "Hiccup Mode", and the output overvoltage clamp ensures that the output voltage does not exceed Vo,clamp,max. This secondary control loop provides a redundant voltage control that reduces the risk of output overvoltage.

Output Current Protection

To provide protection in an output overload or short circuit condition, the converter is equipped with current limiting circuitry and can endure the fault condition for an unlimited duration. At the point of current-limit inception, the converter goes into "Hiccup Mode", causing the output current to be limited both in peak and duration. The converter operates normally once the output current is brought back into its specified range.

Enable

Two enable options are available. Positive Logic Enable and Negative Logic Enable. Positive Logic Enable turns the converter ON during a logic-high voltage on the enable pin, and OFF during a logic-low. Negative Logic Enable turns the converter OFF during a logic-high and ON during a logic-low.

Output Voltage Adjustment

Output voltage adjustment is accomplished by connecting an external resistor between the Trim Pin and either the +Vo1 or –Vo1 Pins.

With an external resistor between the Trim Pin and +Vo1 Pin (Radj-down) the output voltage set point (Vo,adj) decreases. The following equation determines the required external resistor value to obtain an adjusted output voltage:

$$\text{Radj, dn} = \left[\frac{(Vo, adj - D)A}{Vo, nom - Vo, adj} - B \right] \text{ohm}$$

Where Radj-down is the resistance value and A, B, and D are defined in Table 7.

With an external resistor between the Trim Pin and –Vo1 Pin (Radj-up) the output voltage set point (Vo,adj) increases. The following equation determines the required external resistor value to obtain an adjusted output voltage:

$$\text{Radj, up} = \left[\frac{A \bullet D}{(Vo, adj - D) - C} - B \right] \text{ohm}$$

Where Radj-up is the resistance value and A, B, C, and D are defined in Table 12.

Table 12.Output Adjustment Variables

Output	A	B	C	D
Vo1	4990	2000	2.5	2.5
Vo2	4990	2000	0.8	2.5

THERMAL CONSIDERATIONS

The power converter operates in a variety of thermal environments: however, sufficient cooling should be provided to help ensure reliable operation of the converter. Heat-dissipating components are thermally coupled to the case. Heat is removed by conduction, convection, and radiation to the surrounding environment. Proper cooling can be verified by measuring the case temperature.

Heat Transfer Characteristics

Increasing airflow over the converter enhances the heat transfer via convection. Figure 4 shows the maximum power that can be dissipated by the converter without exceeding the maximum case temperature versus local ambient temperature (T_A) for natural convection through 400 ft/min.

Systems in which these converters are used generate airflow rates of 50 ft/min due to other heat dissipating components in the system. Therefore, the natural convection condition represents airflow rates of approximately 50 ft/min. Use of Figure 4 is shown in the following example.

Example

What is the minimum airflow required for the device operating at 24 V, an output power of 60 W, and maximum ambient temperature of 60 ºC.

Solution:
        Given: Vi = 24 V, Po = 60 W, T_A = 60 ºC.
        Determine P_D (Figure 4): P_D = 13 W.
   Determine airflow (Figure 4): v = 200 ft/min
