The HYM322160S/GS-60/-70 is a 8 MByte DRAM module organized as 2 097 152 words by 32-Bit in a 72-pin single-in-line package comprising sixteen HYB514400BJ 1M x 4 DRAMs in 300 mil wide SOJ-packages mounted together with eight 0.2 μ F ceramic decoupling capacitors on a PC board.

The HYM322160S/GS-60/-70 can also be used as a 4 194 304 words by 16-Bits dynamic RAM module by means of connecting DQ0 and DQ16, DQ1 and DQ17, DQ2 and DQ18, ..., DQ15 and DQ31, respectively.

Each HYB514400BJ is described in the data sheet and is fully electrical tested and processed according to SIEMENS standard quality procedure prior to module assembly. After assembly onto the board, a further set of electrical tests is performed.

The speed of the module can be detected by the use of four presence detect pins.

The common I/O feature on the HYM 322160S/GS-60/-70 dictates the use of early write cycles.

Notes:

- 1) All voltages are referenced to V_{SS} .
- 2) I_{CC1} , I_{CC3} , I_{CC4} and I_{CC6} depend on cycle rate.
- 3) I_{CC1} and I_{CC4} depend on output loading. Specified values are measured with the output open.
- 4) An initial pause of 200 μ s is required after power-up followed by 8 \overline{RAS} cycles out of which at least one cycle has to be a refresh cycle before proper device operation is achieved. In case of using internal refresh counter, a minimum of 8 CAS-before- \overline{RAS} initialization cycles instead of 8 \overline{RAS} cycles are required.
- 5) V_{IH} (min.) and V_{IL} (max.) are reference levels for measuring timing of input signals. Transition times are also measured between V_{IH} and V_{IL} .
- 6) Measured with a load equivalent of 2 TTL loads and 100 pF.
- 7) t_{OFF} (max.) defines the time at which the output achieves the open-circuit condition and is not referenced to output voltage levels.
- 8) Either t_{RCH} or t_{RRH} must be satisfied for a read cycle.
- 9) These parameters are referenced to the \overline{CAS} leading edge.
- 10) t_{WCS} is not a restrictive operating parameter. This is included in the data sheet as electrical characteristic only. If $t_{WCS} > t_{WCS}(\text{min.})$, the cycle is an early write cycle and data out pin will remain open circuit (high impedance).
- 11) Operation within the $t_{RCD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RCD}(\text{max.})$ is specified as a reference point only. If t_{RCD} is greater than the specified $t_{RCD}(\text{max.})$ limit, then access time is controlled by t_{CAC} .
- 12) Operation within the $t_{RAD}(\text{max.})$ limit insures that $t_{RAC}(\text{max.})$ can be met. $t_{RAD}(\text{max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{max.})$ limit, then access time is controlled by t_{AA} .
- 13) For \overline{CAS} -before- \overline{RAS} cycles only.
