# 64K x 16 (1-MBIT) DYNAMIC RAM WITH FAST PAGE MODE

## FEATURES

- Fast access and cycle time
- TTL compatible inputs and outputs
- Refresh Interval: 256 cycles/4 ms
- Refresh Mode:  $\overline{\text{RAS}}$ -Only,  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  (CBR), Hidden
- JEDEC standard pinout
- Single power supply:
  - $5V \pm 10\%$  (IC41C1665)
  - $3.3V \pm 10\%$  (IC41LV1665)
- Byte Write and Byte Read operation via two  $\overline{\text{CAS}}$
- Available in 40-pin SOJ and TSOP-2

## DESCRIPTION

The ICSI IC41C1665 and the IC41LV1665 are 65,536 x 16-bit high-performance CMOS Dynamic Random Access Memory. Fast Page Mode allows 256 random accesses within a single row with access cycle time as short as 12 ns per 16-bit word. The Byte Write control, of upper and lower byte, makes these devices ideal for use in 16-, 32-bit wide data bus systems.

These features make the IC41C1665 and the IC41LV1665 ideally suited for high band-width graphics, digital signal processing, high-performance computing systems, and peripheral applications.

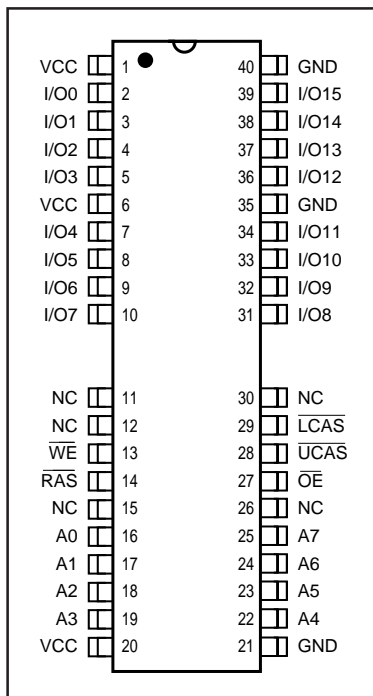

The IC41C1665 and the IC41LV1665 are packaged in a 40-pin, 400mil SOJ and TSOP-2.

**Notes:**

1. These WRITE cycles may also be BYTE WRITE cycles (either  $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$  active).
2. These READ cycles may also be BYTE READ cycles (either  $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$  active).
3. At least one of the two CAS signals must be active ( $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$ ).

## FUNCTIONAL DESCRIPTION

The IC41C1665 and the IC41LV1665 are CMOS DRAMs optimized for high-speed bandwidth, low-power applications. During READ or WRITE cycles, each bit is uniquely addressed through the 16 address bits. These are entered nine bits (A0-A7) at a time. The row address is latched by the Row Address Strobe ( $\overline{\text{RAS}}$ ). The column address is latched by the Column Address Strobe ( $\overline{\text{CAS}}$ ).  $\overline{\text{RAS}}$  is used to latch the first eight bits and  $\overline{\text{CAS}}$  is used to latch the latter eight bits.

The IC41C1665 and the IC41LV1665 have two  $\overline{\text{CAS}}$  controls,  $\overline{\text{LCAS}}$  and  $\overline{\text{UCAS}}$ . The  $\overline{\text{LCAS}}$  and  $\overline{\text{UCAS}}$  inputs internally generate a  $\overline{\text{CAS}}$  signal functioning in an identical manner to the single  $\overline{\text{CAS}}$  input on the other 64K x 16 DRAMs. The key difference is that each  $\overline{\text{CAS}}$  controls its corresponding I/O tristate logic (in conjunction with  $\overline{\text{OE}}$  and  $\overline{\text{WE}}$  and  $\overline{\text{RAS}}$ ).  $\overline{\text{LCAS}}$  controls I/O0 - I/O7 and  $\overline{\text{UCAS}}$  controls I/O8 - I/O15.

The IC41C1665/IC41LV1665  $\overline{\text{CAS}}$  function is determined by the first  $\overline{\text{CAS}}$  ( $\overline{\text{LCAS}}$  or  $\overline{\text{UCAS}}$ ) transitioning LOW and the last transitioning back HIGH. The two  $\overline{\text{CAS}}$  controls give the IC41C1665 both BYTE READ and BYTE WRITE cycle capabilities.

### Memory Cycle

A memory cycle is initiated by bringing  $\overline{\text{RAS}}$  LOW and it is terminated by returning both  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$  HIGH. To ensure proper device operation and data integrity any memory cycle, once initiated, must not be ended or aborted before the minimum  $t_{\text{RAS}}$  time has expired. A new cycle must not be initiated until the minimum precharge time  $t_{\text{RP}}$ ,  $t_{\text{CP}}$  has elapsed.

### Read Cycle

A read cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{OE}}$ , whichever occurs last, while holding  $\overline{\text{WE}}$  HIGH. The column address must be held for a minimum time specified by  $t_{\text{AR}}$ . Data Out becomes valid only when  $t_{\text{RAC}}$ ,  $t_{\text{AA}}$ ,  $t_{\text{CAC}}$  and  $t_{\text{OE}}$  are all satisfied. As a result, the access time is dependent on the timing relationships between these parameters.

### Write Cycle

A write cycle is initiated by the falling edge of  $\overline{\text{CAS}}$  and  $\overline{\text{WE}}$ , whichever occurs last. The input data must be valid at or before the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{WE}}$ , whichever occurs last.

### Refresh Cycle

To retain data, 256 refresh cycles are required in each 4 ms period. There are two ways to refresh the memory:

1. By clocking each of the 256 row addresses (A0 through A7) with  $\overline{\text{RAS}}$  at least once every 4 ms. Any read, write, read-modify-write or  $\overline{\text{RAS}}$ -only cycle refreshes the addressed row.
2. Using a  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle.  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh is activated by the falling edge of  $\overline{\text{RAS}}$ , while holding  $\overline{\text{CAS}}$  LOW. In  $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  refresh cycle, an internal 8-bit counter provides the row addresses and the external address inputs are ignored.

$\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$  is a refresh-only mode and no data access or device selection is allowed. Thus, the output remains in the High-Z state during the cycle.

### Power-On

After application of the  $V_{\text{CC}}$  supply, an initial pause of 200  $\mu\text{s}$  is required followed by a minimum of eight initialization cycles (any combination of cycles containing a  $\overline{\text{RAS}}$  signal).

During power-on, it is recommended that  $\overline{\text{RAS}}$  track with  $V_{\text{CC}}$  or be held at a valid  $V_{\text{IH}}$  to avoid current surges.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Symbol	Parameters		Rating	Unit
V <sub>T</sub>	Voltage on Any Pin Relative to GND	5V	-1.0 to +7.0	V
		3.3V	-0.5 to +4.6	V
V <sub>CC</sub>	Supply Voltage	5V	-1.0 to +7.0	V

T <sub>STG</sub>	Storage Temperature		-55 to +125	°C

**Note:**

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**Notes:**

1. An initial pause of 200 μs is required after power-up followed by eight  $\overline{RAS}$  refresh cycles ( $\overline{RAS}$ -Only or CBR) before proper device operation is assured. The eight  $\overline{RAS}$  cycles wake-up should be repeated any time the t<sub>REF</sub> refresh requirement is exceeded.
2. Dependent on cycle rates.
3. Specified values are obtained with minimum cycle time and the output open.
4. Column-address is changed once each fast page cycle.
5. Enables on-chip refresh and address counters.

Output load: Two TTL Loads and 50 pF (Vcc = 5.0V ±10%)  
One TTL Load and 50 pF (Vcc = 3.3V ±10%)

Input timing reference levels: V<sub>IH</sub> = 2.4V, V<sub>IL</sub> = 0.8V (Vcc = 5.0V ±10%);  
V<sub>IH</sub> = 2.0V, V<sub>IL</sub> = 0.8V (Vcc = 3.3V ±10%)

Output timing reference levels: V<sub>OH</sub> = 2.0V, V<sub>OL</sub> = 0.8V (Vcc = 5V ±10%, 3.3V ±10%)

**Notes:**

1. An initial pause of 200  $\mu$ s is required after power-up followed by eight  $\overline{\text{RAS}}$  refresh cycle ( $\overline{\text{RAS}}$ -Only or CBR) before proper device operation is assured. The eight RAS cycles wake-up should be repeated any time the  $t_{\text{REF}}$  refresh requirement is exceeded.
2.  $V_{\text{IH}}$  (MIN) and  $V_{\text{IL}}$  (MAX) are reference levels for measuring timing of input signals. Transition times, are measured between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) and assume to be 1 ns for all inputs.
3. In addition to meeting the transition rate specification, all input signals must transit between  $V_{\text{IH}}$  and  $V_{\text{IL}}$  (or between  $V_{\text{IL}}$  and  $V_{\text{IH}}$ ) in a monotonic manner.
4. If  $\text{CAS}$  and  $\text{RAS} = V_{\text{IH}}$ , data output is High-Z.
5. If  $\text{CAS} = V_{\text{IL}}$ , data output may contain data from the last valid READ cycle.
6. Measured with a load equivalent to one TTL gate and 50 pF.
7. Assumes that  $t_{\text{RCD}} \leq t_{\text{RCD}} (\text{MAX})$ . If  $t_{\text{RCD}}$  is greater than the maximum recommended value shown in this table,  $t_{\text{RAC}}$  will increase by the amount that  $t_{\text{RCD}}$  exceeds the value shown.
8. Assumes that  $t_{\text{RCD}} \geq t_{\text{RCD}} (\text{MAX})$ .
9. If  $\text{CAS}$  is LOW at the falling edge of  $\text{RAS}$ , data out will be maintained from the previous cycle. To initiate a new cycle and clear the data output buffer,  $\overline{\text{CAS}}$  and  $\text{RAS}$  must be pulsed for  $t_{\text{CP}}$ .
10. Operation with the  $t_{\text{RCD}} (\text{MAX})$  limit ensures that  $t_{\text{RAC}} (\text{MAX})$  can be met.  $t_{\text{RCD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RCD}}$  is greater than the specified  $t_{\text{RCD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{CAC}}$ .
11. Operation within the  $t_{\text{RAD}} (\text{MAX})$  limit ensures that  $t_{\text{RCD}} (\text{MAX})$  can be met.  $t_{\text{RAD}} (\text{MAX})$  is specified as a reference point only; if  $t_{\text{RAD}}$  is greater than the specified  $t_{\text{RAD}} (\text{MAX})$  limit, access time is controlled exclusively by  $t_{\text{AA}}$ .
12. Either  $t_{\text{RCH}}$  or  $t_{\text{RRH}}$  must be satisfied for a READ cycle.
13.  $t_{\text{OFF}} (\text{MAX})$  defines the time at which the output achieves the open circuit condition; it is not a reference to  $V_{\text{OH}}$  or  $V_{\text{OL}}$ .
14.  $t_{\text{WCS}}$ ,  $t_{\text{RWD}}$ ,  $t_{\text{AWD}}$  and  $t_{\text{CWD}}$  are restrictive operating parameters in LATE WRITE and READ-MODIFY-WRITE cycle only. If  $t_{\text{WCS}} \geq t_{\text{WCS}} (\text{MIN})$ , the cycle is an EARLY WRITE cycle and the data output will remain open circuit throughout the entire cycle. If  $t_{\text{RWD}} \geq t_{\text{RWD}} (\text{MIN})$ ,  $t_{\text{AWD}} \geq t_{\text{AWD}} (\text{MIN})$  and  $t_{\text{CWD}} \geq t_{\text{CWD}} (\text{MIN})$ , the cycle is a READ-WRITE cycle and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of I/O (at access time and until  $\overline{\text{CAS}}$  and  $\overline{\text{RAS}}$  or  $\overline{\text{OE}}$  go back to  $V_{\text{IH}}$ ) is indeterminate.  $\overline{\text{OE}}$  held HIGH and  $\overline{\text{WE}}$  taken LOW after  $\overline{\text{CAS}}$  goes LOW result in a LATE WRITE ( $\overline{\text{OE}}$ -controlled) cycle.
15. Output parameter (I/O) is referenced to corresponding  $\text{CAS}$  input, I/O0-I/O7 by  $\overline{\text{LCAS}}$  and I/O8-I/O15 by  $\overline{\text{UCAS}}$ .
16. During a READ cycle, if  $\text{OE}$  is LOW then taken HIGH before  $\text{CAS}$  goes HIGH, I/O goes open. If  $\text{OE}$  is tied permanently LOW, a LATE WRITE or READ-MODIFY-WRITE is not possible.
17. Write command is defined as  $\overline{\text{WE}}$  going low.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both  $t_{\text{OD}}$  and  $t_{\text{OEH}}$  met ( $\overline{\text{OE}}$  HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The I/Os will provide the previously written data if  $\overline{\text{CAS}}$  remains LOW and  $\overline{\text{OE}}$  is taken back to LOW after  $t_{\text{OEH}}$  is met.
19. The I/Os are in open during READ cycles once  $t_{\text{OD}}$  or  $t_{\text{OFF}}$  occur.
20. The first  $\chi\overline{\text{CAS}}$  edge to transition LOW.
21. The last  $\chi\overline{\text{CAS}}$  edge to transition HIGH.
22. These parameters are referenced to  $\overline{\text{CAS}}$  leading edge in EARLY WRITE cycles and  $\overline{\text{WE}}$  leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
23. Last falling  $\chi\overline{\text{CAS}}$  edge to first rising  $\chi\overline{\text{CAS}}$  edge.
24. Last rising  $\chi\overline{\text{CAS}}$  edge to next cycle's last rising  $\chi\overline{\text{CAS}}$  edge.
25. Last rising  $\chi\overline{\text{CAS}}$  edge to first falling  $\chi\overline{\text{CAS}}$  edge.
26. Each  $\chi\overline{\text{CAS}}$  must meet minimum pulse width.
27. Last  $\chi\overline{\text{CAS}}$  to go LOW.
28. I/Os controlled, regardless  $\overline{\text{UCAS}}$  and  $\overline{\text{LCAS}}$ .
29. The 3 ns minimum is a parameter guaranteed by design.
30. Enables on-chip refresh and address counters.

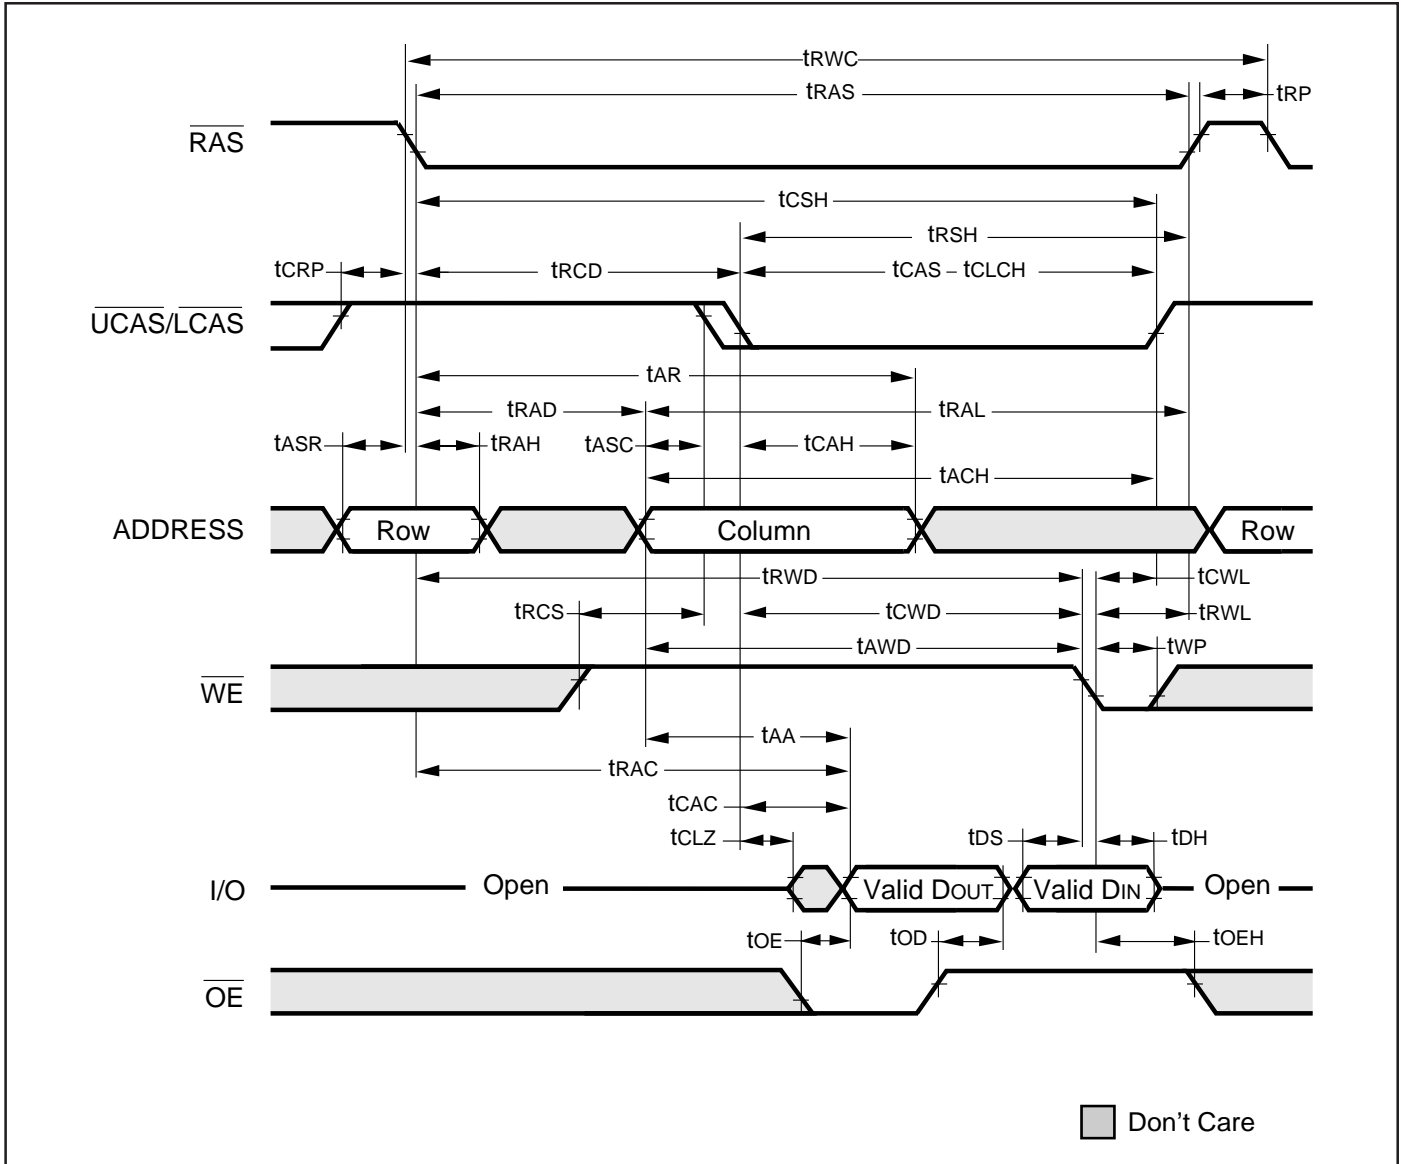

READ CYCLE

**Note:**

1.  $t_{OFF}$  is referenced from rising edge of  $\overline{RAS}$  or  $\overline{CAS}$ , whichever occurs last.

**READ WRITE CYCLE (LATE WRITE and READ-MODIFY-WRITE Cycles)**

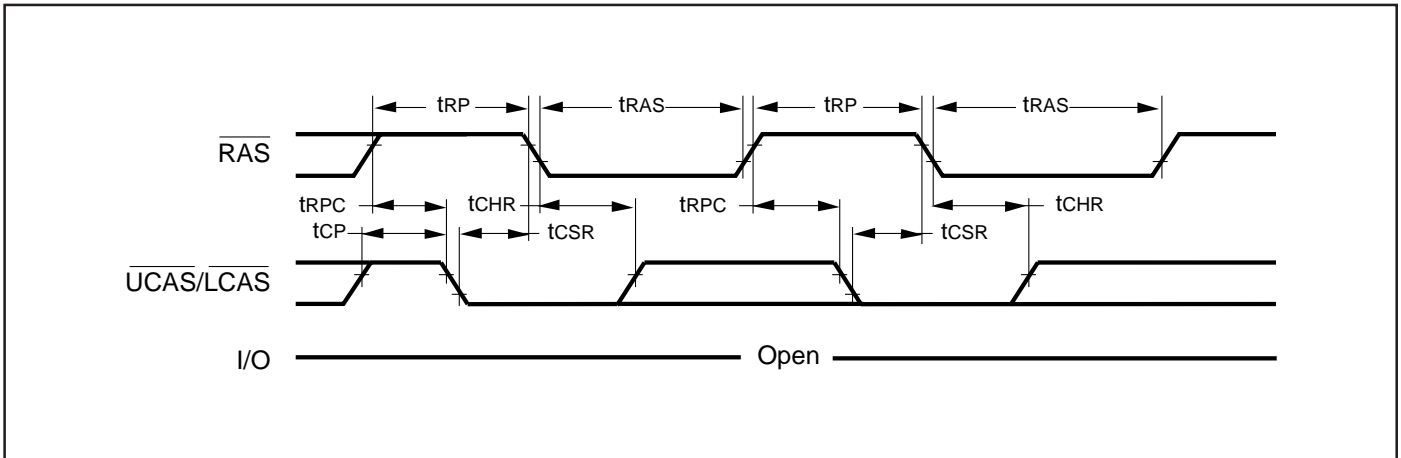

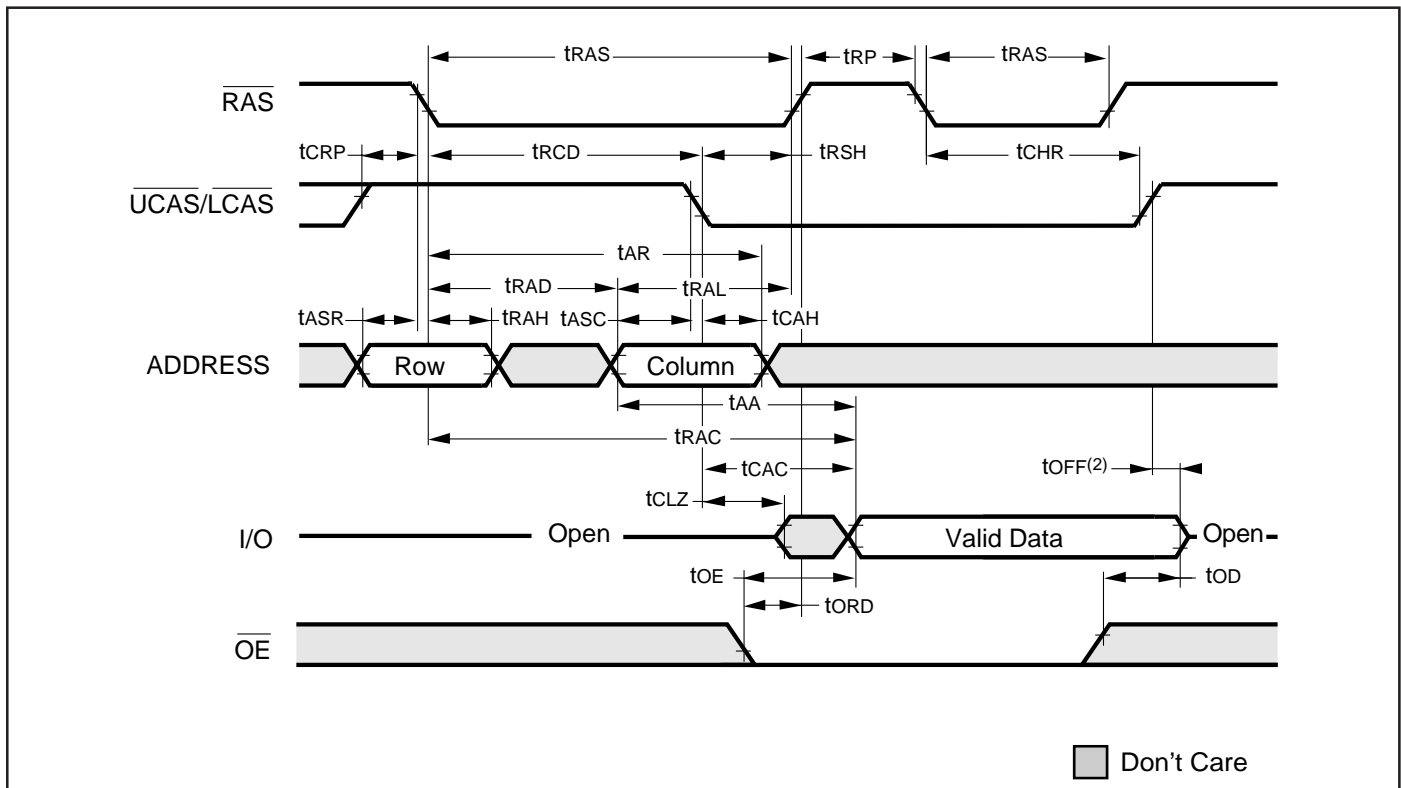

**CBR REFRESH CYCLE** (Addresses;  $\overline{WE}$ ,  $\overline{OE}$  = DON'T CARE)

**HIDDEN REFRESH CYCLE<sup>(1)</sup>** ( $\overline{WE}$  = HIGH;  $\overline{OE}$  = LOW)

**Notes:**

1. A Hidden Refresh may also be performed after a Write Cycle. In this case,  $\overline{WE}$  = LOW and  $\overline{OE}$  = HIGH.
2.  $t_{off}$  is referenced from rising edge of RAS or CAS, whichever occurs last.
