

# 16 pin Intel Graphics Clock Source

## Description

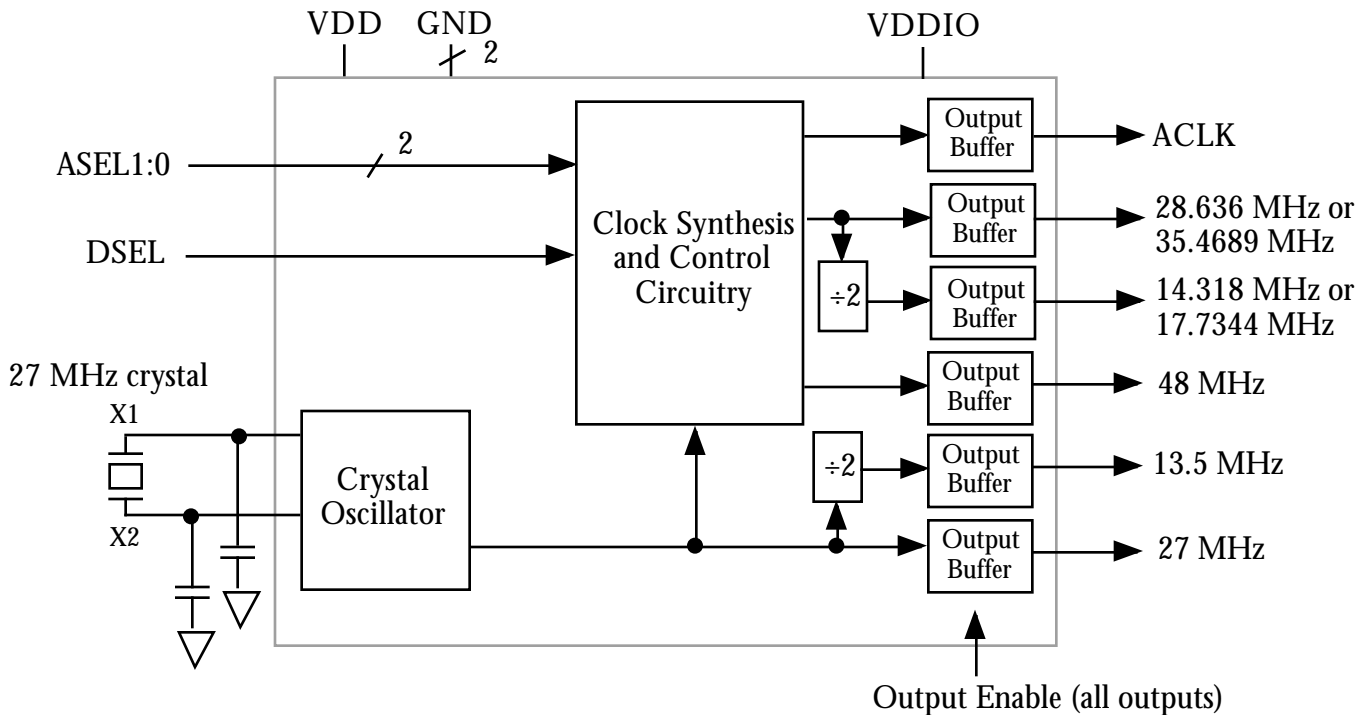

The ICS614-01 is a low cost, low jitter, high performance clock synthesizer for Intel's i752 graphics systems. It includes frequencies for video encoders and decoders. Using analog Phase-Locked Loop (PLL) techniques, the device accepts a 27 MHz fundamental mode crystal or clock input to produce multiple output clocks. The chip provides highly accurate video encoder and decoder clocks, as well as the 48 MHz necessary for the Intel graphics processor, and can produce a 24.576 MHz audio clock.

See the ICS604 or ICS513 for 8 pin devices that supply 48 MHz from a 14.31818 MHz input.

### External Components/Crystal Selection

The ICS614-01 requires a minimum number of external components for proper operation. Decoupling capacitors of 0.01  $\mu\text{F}$  should be connected between VDD and GND, one between pins 4 and 5, and one between pins 13 and 12, as close to the part as possible. A series termination resistor of 33  $\Omega$  may be used for each clock output. The 27.000 MHz crystal must be connected as close to the chip as possible. The crystal should be a fundamental mode, parallel resonant, 30 ppm or better. Do not use third overtone. Crystal capacitors should be connected from pins X1 to ground and X2 to ground. In general, the value of these capacitors is given by the following equation, where  $C_L$  is the crystal load capacitance: Crystal caps (pF) =  $(C_L - 6) \times 2$ . So for a crystal with 16 pF load capacitance, two 20 pF caps can be used. For any given board layout, ICS can measure the board capacitance and recommend the exact capacitance value to use.
