

DDR and SDRAM Zero Delay Buffer

Recommended Application:

DDR & SDRAM Zero Delay Buffer for SIS 635/640/645/
650 & 735/740/746 style chipsets.

Product Description/Features:

- Low skew, Zero Delay Buffer
- 1 to 13 SDRAM PC133 clock distribution
- 1 to 6 pairs of DDR clock distribution
- I²C for functional and output control
- Separate feedback path for both memory mode to adjust synchronization.
- Supports up to 2 DDR DIMMs or 3 SDRAM DIMMs
- Frequency support for up to 200MHz
- Individual I²C clock stop for power management
- CMOS level control signal input

Switching Characteristics:

- OUTPUT - OUTPUT skew: <100ps
- Output Rise and Fall Time for DDR outputs: 550ps - 1150ps
- DUTY CYCLE: 47% - 53%

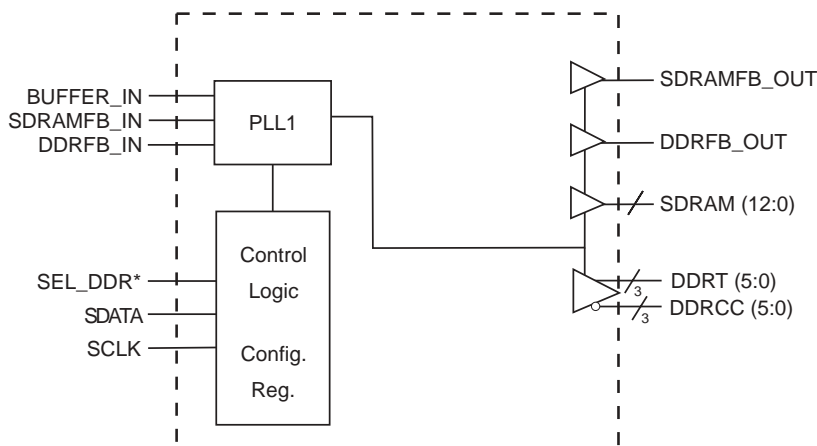

Pin Configuration

48-Pin SSOP

Absolute Maximum Ratings

Supply Voltage (VDD & VDD2.5)	-0.5V to 3.6V
Logic Inputs	GND -0.5 V to V _{DD} +0.5 V
Ambient Operating Temperature	0°C to +85°C
Case Temperature	115°C
Storage Temperature	-65°C to +150°C

Stresses above those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

² While the pulse skew is almost constant over frequency, the duty cycle error increases at higher frequencies. This is due to the formula: $duty\ cycle = t_2/t_1$, where the cycle (t_1) decreases as the frequency goes up.

General I²C serial interface information

The information in this section assumes familiarity with I²C programming. For more information, contact ICS for an I²C programming application note.

How to Write:

- Controller (host) sends a start bit.
- Controller (host) sends the write address D4_(H)
- ICS clock will *acknowledge*
- Controller (host) sends a dummy command code
- ICS clock will *acknowledge*
- Controller (host) sends a dummy byte count
- ICS clock will *acknowledge*
- Controller (host) starts sending first byte (Byte 0) through byte 6
- ICS clock will *acknowledge* each byte *one at a time*.
- Controller (host) sends a Stop bit

How to Read:

- Controller (host) will send start bit.
- Controller (host) sends the read address D5_(H)
- ICS clock will *acknowledge*
- ICS clock will send the *byte count*
- Controller (host) acknowledges
- ICS clock sends first byte (*Byte 0*) through *byte 7*
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a stop bit

Notes:

1. The ICS clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol.**
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I²C interface, the protocol is set to use only "Block-Writes" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.
