#### LIFE SUPPORT POLICY

Integrated Device Technology's products are not authorized for use as critical components in life support devices or systems unless a specific written agreement pertaining to such intended use is executed between the manufacturer and an officer of IDT.

1. Life support devices or systems are devices or systems which (a) are intended for surgical implant into the body or (b) support or sustain life and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
  2. A critical component is any components of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

## **FEATURES**

### **HIGHLIGHTS**

- The first single PLL chip:
  - Features 0.1 Hz to 560 Hz bandwidth
  - Provides node clock for ITU-T G.8261/G.8262 Synchronous Ethernet
  - Exceeds GR-253-CORE (OC-12) and ITU-T G.813 (STM-16/Option I) jitter generation requirements
  - Provides node clocks for Cellular and WLL base-station (GSM and 3G networks)
  - Provides clocks for DSL access concentrators (DSLAM), especially for Japan TCM-ISDN network timing based ADSL equipments

### **MAIN FEATURES**

- Provides an integrated single-chip solution for Synchronous Equipment Timing Source, including Stratum 3, SMC, 4E and 4 clocks
- Employs DPLL and APLL to feature excellent jitter performance and minimize the number of the external components
- Supports Forced or Automatic operating mode switch controlled by an internal state machine; the primary operating modes are Free-Run, Locked and Holdover
- Supports programmable DPLL bandwidth (0.1 Hz to 560 Hz in 11 steps) and damping factor (1.2 to 20 in 5 steps)
- Supports  $1.1 \times 10^{-5}$  ppm absolute holdover accuracy and  $4.4 \times 10^{-8}$  ppm instantaneous holdover accuracy
- Supports PBO to minimize phase transients on T0 DPLL output to be no more than 0.61 ns
- Supports phase absorption when phase-time changes on T0 selected input clock are greater than a programmable limit over an interval of less than 0.1 seconds
- Supports programmable input-to-output phase offset adjustment
- Limits the phase and frequency offset of the outputs
- Supports manual and automatic selected input clock switch

- Supports automatic hitless selected input clock switch on clock failure
- Supports three types of input clock sources: recovered clock from STM-N or OC-n, PDH network synchronization timing and external synchronization reference timing
- Provides three 2 kHz, 4 kHz or 8 kHz frame sync input signals, and a 2 kHz and an 8 kHz frame sync output signals
- Provides 5 input clocks whose frequency cover from 2 kHz to 622.08 MHz
- Provides 2 output clocks whose frequency cover from 1 Hz to 622.08 MHz
- Provides output clocks for BITS, GPS, 3G, GSM, etc.
- Supports PECL/LVDS and CMOS input/output technologies
- Supports master clock calibration
- Supports Line Card application
- Meets Telcordia GR-1244-CORE, GR-253-CORE, ITU-T G.812, ITU-T G.813 and ITU-T G.783 criteria

### **OTHER FEATURES**

- Serial microprocessor interface mode
- IEEE 1149.1 JTAG Boundary Scan
- Single 3.3 V operation with 5 V tolerant CMOS I/Os
- 64-pin TQFP package, Green package options available

### **APPLICATIONS**

- BITS / SSU
- SMC / SEC (SONET / SDH)
- DWDM cross-connect and transmission equipments
- Synchronous Ethernet equipments
- Central Office Timing Source and Distribution
- Core and access IP switches / routers
- Gigabit and Terabit IP switches / routers
- IP and ATM core switches and access equipments
- Cellular and WLL base-station node clocks
- Broadband and multi-service access equipments
- Any other telecom equipments that need synchronous equipment system timing

## DESCRIPTION

The IDT82V3352 is an integrated, single-chip solution for the Synchronous Equipment Timing Source for Stratum 3, SMC, 4E and 4 clocks in SONET / SDH equipments, DWDM and Wireless base station, such as GSM, 3G, DSL concentrator, Router and Access Network applications.

The device supports three types of input clock sources: recovered clock from STM-N or OC-n, PDH network synchronization timing and external synchronization reference timing.

The T0 path supports three primary operating modes: Free-Run, Locked and Holdover. In Free-Run mode, the DPLL refers to the master clock. In Locked mode, the DPLL locks to the selected input clock. In Holdover mode, the DPLL resorts to the frequency data acquired in Locked mode. Whatever the operating mode is, the DPLL gives a stable performance without being affected by operating conditions or silicon process variations.

If the DPLL outputs are processed by T0/T4 APLL, the outputs of the device will be in a better jitter/wander performance.

The device provides programmable DPLL bandwidths: 0.1 Hz to 560 Hz in 11 steps and damping factors: 1.2 to 20 in 5 steps. Different settings cover all SONET / SDH clock synchronization requirements.

A high stable input is required for the master clock in different applications. The master clock is used as a reference clock for all the internal circuits in the device. It can be calibrated within  $\pm 741$  ppm.

All the read/write registers are accessed through a serial microprocessor interface. The device supports Serial microprocessor interface mode only.

The device can be used typically in [Chapter 3.17 Line Card Application](#).

## 2 PIN DESCRIPTION

Table 1: Pin Description

Name	Pin No.	I/O	Type	Description <sup>1</sup>
<b>Global Control Signal</b>				
OSCI	6	I	CMOS	<b>OSCI: Crystal Oscillator Master Clock</b> A nominal 12.8000 MHz clock provided by a crystal oscillator is input on this pin. It is the master clock for the device.
FF_SRCSW	13	I pull-down	CMOS	<b>FF_SRCSW: External Fast Selection Enable</b> During reset, this pin determines the default value of the EXT_SW bit (b4, 0BH) <sup>2</sup> . The EXT_SW bit determines whether the External Fast Selection is enabled. High: The default value of the EXT_SW bit (b4, 0BH) is '1' (External Fast selection is enabled); Low: The default value of the EXT_SW bit (b4, 0BH) is '0' (External Fast selection is disabled). After reset, this pin selects an input clock pair for the T0 DPLL if the External Fast selection is enabled: High: Pair IN1_CMOS / IN1_DIFF is selected. Low: Pair IN2_CMOS / IN2_DIFF is selected. After reset, the input on this pin takes no effect if the External Fast selection is disabled.
SONET/SDH	64	I pull-down	CMOS	<b>SONET/SDH: SONET / SDH Frequency Selection</b> During reset, this pin determines the default value of the IN_SONET_SDH bit (b2, 09H): High: The default value of the IN_SONET_SDH bit is '1' (SONET); Low: The default value of the IN_SONET_SDH bit is '0' (SDH). After reset, the value on this pin takes no effect.
RST	48	I pull-up	CMOS	<b>RST: Reset</b> A low pulse of at least 50 $\mu$ s on this pin resets the device. After this pin is high, the device will still be held in reset state for 500 ms (typical).
<b>Frame Synchronization Input Signal</b>				
EX_SYNC1	28	I pull-down	CMOS	<b>EX_SYNC1: External Sync Input 1</b> A 2 kHz, 4 kHz or 8 kHz signal is input on this pin.
EX_SYNC2	33	I pull-down	CMOS	<b>EX_SYNC2: External Sync Input 2</b> A 2 kHz, 4 kHz or 8 kHz signal is input on this pin.
EX_SYNC3	35	I pull-down	CMOS	<b>EX_SYNC3: External Sync Input 3</b> A 2 kHz, 4 kHz or 8 kHz signal is input on this pin.
<b>Input Clock</b>				
IN1_CMOS	29	I pull-down	CMOS	<b>IN1_CMOS: Input Clock 1</b> A 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz or 155.52 MHz clock is input on this pin.
IN2_CMOS	30	I pull-down	CMOS	<b>IN2_CMOS: Input Clock 2</b> A 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz or 155.52 MHz clock is input on this pin.
IN1_POS	23	I	PECL/LVDS	<b>IN1_POS / IN1_NEG: Positive / Negative Input Clock 1</b> A 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz, 155.52 MHz, 156.25 MHz, 311.04 MHz or 622.08 MHz clock is differentially input on this pair of pins. Whether the clock signal is PECL or LVDS is automatically detected.
IN1_NEG	24			
IN2_POS	25	I	PECL/LVDS	<b>IN2_POS / IN2_NEG: Positive / Negative Input Clock 2</b> A 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz, 155.52 MHz, 156.25 MHz, 311.04 MHz or 622.08 MHz clock is differentially input on this pair of pins. Whether the clock signal is PECL or LVDS is automatically detected.
IN2_NEG	26			

Table 1: Pin Description (Continued)

Name	Pin No.	I/O	Type	Description <sup>1</sup>
IN3_CMOS	34	I pull-down	CMOS	<b>IN3_CMOS: Input Clock 3</b> A 2 kHz, 4 kHz, N x 8 kHz <sup>3</sup> , 1.544 MHz (SONET) / 2.048 MHz (SDH), 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz or 155.52 MHz clock is input on this pin.
<b>Output Frame Synchronization Signal</b>				
FRSYNC_8K	17	O	CMOS	<b>FRSYNC_8K: 8 kHz Frame Sync Output</b> An 8 kHz signal is output on this pin.
MFRSYNC_2K	18	O	CMOS	<b>MFRSYNC_2K: 2 kHz Multiframe Sync Output</b> A 2 kHz signal is output on this pin.
<b>Output Clock</b>				
OUT1_POS OUT1_NEG	19 20	O	PECL/LVDS	<b>OUT1_POS / OUT1_NEG: Positive / Negative Output Clock 1</b> A 1 Hz, 400 Hz, 2 kHz, 8 kHz, 64 kHz, N x E1 <sup>4</sup> , N x T1 <sup>5</sup> , N x 13.0 MHz <sup>6</sup> , N x 3.84 MHz <sup>7</sup> , 5 MHz, 10 MHz, 20 MHz, 25 MHz, E3, T3, 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz, 125 MHz, 155.52 MHz, 156.25 MHz, 311.04 MHz, 312.5 MHz or 622.08 MHz clock is differentially output on this pair of pins.
OUT2	56	O	CMOS	<b>OUT2: Output Clock 2</b> A 1 Hz, 400 Hz, 2 kHz, 8 kHz, 64 kHz, N x E1 <sup>4</sup> , N x T1 <sup>5</sup> , N x 13.0 MHz <sup>6</sup> , N x 3.84 MHz <sup>7</sup> , 5 MHz, 10 MHz, 20 MHz, 25 MHz, E3, T3, 6.48 MHz, 19.44 MHz, 25.92 MHz, 38.88 MHz, 51.84 MHz, 77.76 MHz, 125 MHz, 155.52 MHz, 156.25 MHz or 312.5 MHz clock is output on this pin.
<b>Microprocessor Interface</b>				
$\overline{\text{CS}}$	44	I pull-up	CMOS	<b><math>\overline{\text{CS}}</math>: Chip Selection</b> A transition from high to low must occur on this pin for each read or write operation and this pin should remain low until the operation is over.
INT_REQ	5	O	CMOS	<b>INT_REQ: Interrupt Request</b> This pin is used as an interrupt request. The output characteristics are determined by the HZ_EN bit (b1, 0CH) and the INT_POL bit (b0, 0CH).
SDI CLKE	43 42	I pull-down	CMOS	<b>SDI: Serial Data Input</b> In Serial mode, this pin is used as the serial data input. Address and data on this pin are serially clocked into the device on the rising edge of SCLK.  <b>CLKE: SCLK Active Edge Selection</b> In Serial mode, this pin selects the active edge of SCLK to update the SDO: High - The falling edge; Low - The rising edge.
SDO	52	I/O pull-down	CMOS	<b>SDO: Serial Data Output</b> In Serial mode, this pin is used as the serial data output. Data on this pin is serially clocked out of the device on the active edge of SCLK.
SCLK	47	I pull-down	CMOS	<b>SCLK: Shift Clock</b> In Serial mode, a shift clock is input on this pin. Data on SDI is sampled by the device on the rising edge of SCLK. Data on SDO is updated on the active edge of SCLK. The active edge is determined by the CLKE.
<b>JTAG (per IEEE 1149.1)</b>				
$\overline{\text{TRST}}$	37	I pull-down	CMOS	<b><math>\overline{\text{TRST}}</math>: JTAG Test Reset (Active Low)</b> A low signal on this pin resets the JTAG test port. This pin should be connected to ground when JTAG is not used.
TMS	41	I pull-up	CMOS	<b>TMS: JTAG Test Mode Select</b> The signal on this pin controls the JTAG test performance and is sampled on the rising edge of TCK.

Table 1: Pin Description (Continued)

Name	Pin No.	I/O	Type	Description <sup>1</sup>
TCK	49	I pull-down	CMOS	<b>TCK: JTAG Test Clock</b> The clock for the JTAG test is input on this pin. TDI and TMS are sampled on the rising edge of TCK and TDO is updated on the falling edge of TCK. If TCK is idle at a low level, all stored-state devices contained in the test logic will indefinitely retain their state.
TDI	51	I pull-up	CMOS	<b>TDI: JTAG Test Data Input</b> The test data is input on this pin. It is clocked into the device on the rising edge of TCK.
TDO	50	O	CMOS	<b>TDO: JTAG Test Data Output</b> The test data is output on this pin. It is clocked out of the device on the falling edge of TCK. TDO pin outputs a high impedance signal except during the process of data scanning. This pin can indicate the interrupt of T0 selected input clock fail, as determined by the LOS_FLAG_ON_TDO bit (b6, 0BH). Refer to <a href="#">Chapter 3.8.1 Input Clock Validity</a> for details.

### 3 FUNCTIONAL DESCRIPTION

#### 3.1 RESET

The reset operation resets all registers and state machines to their default value or status.

After power on, the device must be reset for normal operation.

For a complete reset, the  $\overline{\text{RST}}$  pin must be asserted low for at least 50  $\mu\text{s}$ . After the  $\overline{\text{RST}}$  pin is pulled high, the device will still be in reset state for 500 ms (typical). If the  $\overline{\text{RST}}$  pin is held low continuously, the device remains in reset state.

#### 3.2 MASTER CLOCK

A nominal 12.8000 MHz clock, provided by a crystal oscillator, is input on the OSCI pin. This clock is provided for the device as a master clock. The master clock is used as a reference clock for all the internal circuits. A better active edge of the master clock is selected by the OSC\_EDGE bit to improve jitter and wander performance.

In fact, an offset from the nominal frequency may input on the OSCI pin. This offset can be compensated by setting the NOMINAL\_FREQ\_VALUE[23:0] bits. The calibration range is within  $\pm 741$  ppm.

The performance of the master clock should meet GR-1244-CORE, GR-253-CORE, ITU-T G.812 and G.813 criteria.

### 3.3 INPUT CLOCKS & FRAME SYNC SIGNALS

Altogether 5 clocks and 3 frame sync signals are input to the device.

#### 3.3.1 INPUT CLOCKS

The device provides 5 input clock ports.

According to the input port technology, the input ports support the following technologies:

- PECL/LVDS
- CMOS

According to the input clock source, the following clock sources are supported:

- T1: Recovered clock from STM-N or OC-n
- T2: PDH network synchronization timing
- T3: External synchronization reference timing

IN1\_CMOS ~ IN3\_CMOS support CMOS input signal only and the clock sources can be from T1, T2 or T3.

IN1\_DIFF and IN2\_DIFF support PECL/LVDS input signal only and automatically detect whether the signal is PECL or LVDS. The clock sources can be from T1, T2 or T3.

For SDH and SONET networks, the default frequency is different. SONET / SDH frequency selection is controlled by the IN\_SONET\_SDH bit. During reset, the default value of the IN\_SONET\_SDH bit is determined by the SONET/SDH pin: high for SONET and low for SDH. After reset, the input signal on the SONET/SDH pin takes no effect.

#### 3.3.2 FRAME SYNC INPUT SIGNALS

Three 2 kHz, 4 kHz or 8 kHz frame sync signals are input on the EX\_SYNC1 to EX\_SYNC3 pins respectively. They are CMOS inputs. The input frequency should match the setting in the SYNC\_FREQ[1:0] bits.

Only one of the three frame sync input signals is used for frame sync output signal synchronization. Refer to [Chapter 3.13.2 Frame SYNC Output Signals](#) for details.

### 3.4 INPUT CLOCK PRE-DIVIDER

Each input clock is assigned an internal Pre-Divider. The Pre-Divider is used to divide the clock frequency down to the DPLL required frequency, which is no more than 38.88 MHz. For each input clock, the DPLL required frequency is set by the corresponding IN\_FREQ[3:0] bits.

If the input clock is of 2 kHz, 4 kHz or 8 kHz, the Pre-Divider is bypassed automatically and the corresponding IN\_FREQ[3:0] bits should be set to match the input frequency; the input clock can be inverted, as determined by the IN\_2K\_4K\_8K\_INV bit.

Each Pre-Divider consists of a HF (High Frequency) Divider (only available for IN1\_DIFF and IN2\_DIFF), a DivN Divider and a Lock 8k Divider, as shown in Figure 3.

The HF Divider, which is only available for IN1\_DIFF and IN2\_DIFF, should be used when the input clock is higher than (>) 155.52 MHz. The input clock can be divided by 4, 5 or can bypass the HF Divider, as determined by the IN1\_DIFF\_DIV[1:0]/IN2\_DIFF\_DIV[1:0] bits correspondingly.

Either the DivN Divider or the Lock 8k Divider can be used or both can be bypassed, as determined by the DIRECT\_DIV bit and the LOCK\_8K bit.

When the DivN Divider is used, the division factor setting should observe the following order:

1. Select an input clock by the PRE\_DIV\_CH\_VALUE[3:0] bits;
2. Write the lower eight bits of the division factor to the PRE\_DIVN\_VALUE[7:0] bits;
3. Write the higher eight bits of the division factor to the PRE\_DIVN\_VALUE[14:8] bits.

Once the division factor is set for the input clock selected by the PRE\_DIV\_CH\_VALUE[3:0] bits, it is valid until a different division factor is set for the same input clock. The division factor is calculated as follows:

$$\text{Division Factor} = (\text{the frequency of the clock input to the DivN Divider} \div \text{the frequency of the DPLL required clock set by the IN_FREQ[3:0] bits}) - 1$$

The DivN Divider can only divide the input clock whose frequency is lower than (<) 155.52 MHz.

When the Lock 8k Divider is used, the input clock is divided down to 8 kHz automatically.

The Pre-Divider configuration and the division factor setting depend on the input clock on one of the clock input pin and the DPLL required clock. Here is an example:

The input clock on the IN2\_DIFF pin is 622.08 MHz; the DPLL required clock is 6.48 MHz by programming the IN\_FREQ[3:0] bits of register IN2\_DIFF to '0010'. Do the following step by step to divide the input clock:

1. Use the HF Divider to divide the clock down to 155.52 MHz:  
 $622.08 \div 155.52 = 4$ , so set the IN2\_DIFF\_DIV[1:0] bits to '01';
2. Use the DivN Divider to divide the clock down to 6.48 MHz:  
 Set the PRE\_DIV\_CH\_VALUE[3:0] bits to '0110';  
 Set the DIRECT\_DIV bit in Register IN2\_DIFF\_CNFG to '1' and the LOCK\_8K bit in Register IN2\_DIFF\_CNFG to '0';  
 $155.52 \div 6.48 = 24$ ;  $24 - 1 = 23$ , so set the PRE\_DIVN\_VALUE[14:0] bits to '10111'.

### 3.5 INPUT CLOCK QUALITY MONITORING

The qualities of all the input clocks are always monitored in the following aspects:

- Activity
- Frequency

The qualified clocks are available for T0 DPLL selection. The T0 selected input clocks have to be monitored further. Refer to [Chapter 3.7 Selected Input Clock Monitoring](#) for details.

#### 3.5.1 ACTIVITY MONITORING

Activity is monitored by using an internal leaky bucket accumulator, as shown in [Figure 4](#).

Each input clock is assigned an internal leaky bucket accumulator. The input clock is monitored for each period of 128 ms and the internal leaky bucket accumulator increases by 1 when an event is detected; it decreases by 1 if no event is detected within the period set by the decay rate. The event is that an input clock drifts outside ( $>$ )  $\pm 500$  ppm with respect to the master clock within a 128 ms period.

There are four configurations (0 - 3) for a leaky bucket accumulator. The leaky bucket configuration for an input clock is selected by the cor-

responding BUCKET\_SEL[1:0] bits. Each leaky bucket configuration consists of four elements: upper threshold, lower threshold, bucket size and decay rate.

The bucket size is the capability of the accumulator. If the number of the accumulated events reach the bucket size, the accumulator will stop increasing even if further events are detected. The upper threshold is a point above which a no-activity alarm is raised. The lower threshold is a point below which the no-activity alarm is cleared. The decay rate is a certain period during which the accumulator decreases by 1 if no event is detected.

The leaky bucket configuration is programmed by one of four groups of register bits: the BUCKET\_SIZE\_n\_DATA[7:0] bits, the UPPER\_THRESHOLD\_n\_DATA[7:0] bits, the LOWER\_THRESHOLD\_n\_DATA[7:0] bits and the DECAY\_RATE\_n\_DATA[1:0] bits respectively; 'n' is 0 ~ 3.

The no-activity alarm status of the input clock is indicated by the INn\_CMOS\_NO\_ACTIVITY\_ALARM bit (n = 1, 2, or 3) / INn\_DIFF\_NO\_ACTIVITY\_ALARM bit (n = 1 or 2).

The input clock with a no-activity alarm is disqualified for clock selection for T0 DPLL.

**Figure 4. Input Clock Activity Monitoring**

### 3.5.2 FREQUENCY MONITORING

Frequency is monitored by comparing the input clock with a reference clock. The reference clock can be derived from the master clock or the output of T0 DPLL, as determined by the `FREQ_MON_CLK` bit.

A frequency hard alarm threshold is set for frequency monitoring. If the `FREQ_MON_HARD_EN` bit is '1', a frequency hard alarm is raised when the frequency of the input clock with respect to the reference clock is above the threshold; the alarm is cleared when the frequency is below the threshold.

The frequency hard alarm threshold can be calculated as follows:

$$\text{Frequency Hard Alarm Threshold (ppm)} = (\text{ALL\_FREQ\_HARD\_THRESHOLD}[3:0] + 1) \times \text{FREQ\_MON\_FACTOR}[3:0]$$

If the `FREQ_MON_HARD_EN` bit is '1', the frequency hard alarm status of the input clock is indicated by the `INn_CMOS_FREQ_HARD_ALARM` bit ( $n = 1, 2$  or  $3$ ) / `INn_DIFF_FREQ_HARD_ALARM` bit ( $n = 1$  or  $2$ ). When the `FREQ_MON_HARD_EN` bit is '0', no frequency hard alarm is raised even if the input clock is above the frequency hard alarm threshold.

The input clock with a frequency hard alarm is disqualified for clock selection for T0 DPLL.

In addition, if the input clock is 2 kHz, 4 kHz or 8 kHz, its clock edges with respect to the reference clock are monitored. If any edge drifts outside  $\pm 5\%$ , the input clock is disqualified for clock selection for T0 DPLL. The input clock is qualified if any edge drifts inside  $\pm 5\%$ . This function is supported only when the `IN_NOISE_WINDOW` bit is '1'.

The frequency of each input clock with respect to the reference clock can be read by doing the following step by step:

1. Select an input clock by setting the `IN_FREQ_READ_CH[3:0]` bits;
2. Read the value in the `IN_FREQ_VALUE[7:0]` bits and calculate as follows:

$$\text{Input Clock Frequency (ppm)} = \text{IN\_FREQ\_VALUE}[7:0] \times \text{FREQ\_MON\_FACTOR}[3:0]$$

Note that the value set by the `FREQ_MON_FACTOR[3:0]` bits depends on the application.

### 3.6 DPLL INPUT CLOCK SELECTION

The EXT\_SW bit and the T0\_INPUT\_SEL[3:0] bits determine the input clock selection, as shown in Table 6:

**Table 6: Input Clock Selection for T0 Path**

Control Bits		Input Clock Selection
EXT_SW	T0_INPUT_SEL[3:0]	
1	don't-care	External Fast selection
0	other than 0000	Forced selection
	0000	Automatic selection

External Fast selection is done between IN1\_CMOS/IN1\_DIFF and IN2\_CMOS/IN2\_DIFF pairs.

Forced selection is done by setting the related registers.

Automatic selection is done based on the results of input clocks quality monitoring and the related registers configuration.

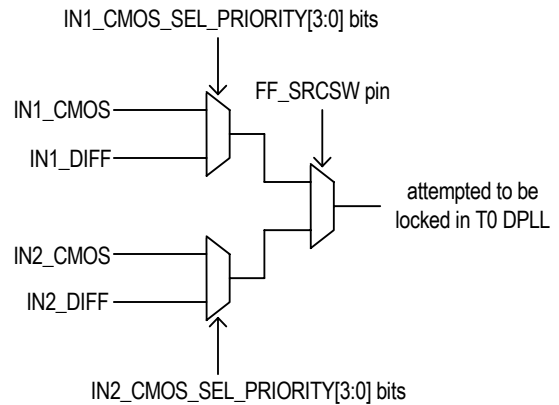

The selected input clock is attempted to be locked in T0 DPLL.

#### 3.6.1 EXTERNAL FAST SELECTION

The External Fast selection is supported by T0 path only. In External Fast selection, only IN1\_CMOS/IN1\_DIFF and IN2\_CMOS/IN2\_DIFF pairs are available for selection. Refer to Figure 5. The results of input

clocks quality monitoring (refer to Chapter 3.5 Input Clock Quality Monitoring) do not affect input clock selection.

The T0 input clock selection is determined by the FF\_SRCSW pin after reset (this pin determines the default value of the EXT\_SW bit during reset, refer to Chapter 2 Pin Description), the IN1\_CMOS\_SEL\_PRIORITY[3:0] bits and the IN2\_CMOS\_SEL\_PRIORITY[3:0] bits, as shown in Figure 5 and Table 7:

**Figure 5. External Fast Selection**

**Table 7: External Fast Selection**

	other than 0000		IN1_CMOS
low	don't-care	0000	IN2_DIFF
		other than 0000	IN2_CMOS

### 3.6.2 FORCED SELECTION

In Forced selection, the selected input clock is set by the T0\_INPUT\_SEL[3:0] bits. The results of input clocks quality monitoring (refer to [Chapter 3.5 Input Clock Quality Monitoring](#)) do not affect the input clock selection.

### 3.6.3 AUTOMATIC SELECTION

In Automatic selection, the input clock selection is determined by its validity and priority. The validity depends on the results of input clock quality monitoring (refer to [Chapter 3.5 Input Clock Quality Monitoring](#)). In all the qualified input clocks, the one with the highest priority is selected. The priority is configured by the corresponding INn\_CMOS\_SEL\_PRIORITY[3:0] bits (n = 1, 2 or 3) / the

INn\_DIFF\_SEL\_PRIORITY[3:0] bits (n = 1 or 2). If more than one qualified input clock is available and has the same priority, the input clock with the smallest 'n' is selected. See [Table 8](#) for the 'n' assigned to the input clock.

**Table 8: 'n' Assigned to the Input Clock**

### 3.7 SELECTED INPUT CLOCK MONITORING

The quality of the selected input clock is always monitored (refer to [Chapter 3.5 Input Clock Quality Monitoring](#)) and the DPLL locking status is always monitored.

#### 3.7.1 DPLL LOCKING DETECTION

The following events is always monitored:

- Fast Loss;
- Coarse Phase Loss;
- Fine Phase Loss;
- Hard Limit Exceeding.

##### 3.7.1.1 Fast Loss

A fast loss is triggered when the selected input clock misses 2 consecutive clock cycles. It is cleared once an active clock edge is detected.

The occurrence of the fast loss will result in T0 DPLL unlocked if the FAST\_LOS\_SW bit is '1'.

##### 3.7.1.2 Coarse Phase Loss

The T0 DPLL compares the selected input clock with the feedback signal. If the phase-compared result exceeds the coarse phase limit, a coarse phase loss is triggered. It is cleared once the phase-compared result is within the coarse phase limit.

When the selected input clock is of 2 kHz, 4 kHz or 8 kHz, the coarse phase limit depends on the MULTI\_PH\_8K\_4K\_2K\_EN bit, the WIDE\_EN bit and the PH\_LOS\_COARSE\_LIMIT[3:0] bits. Refer to [Table 10](#). When the selected input clock is of other frequencies but 2 kHz, 4 kHz and 8 kHz, the coarse phase limit depends on the WIDE\_EN bit and the PH\_LOS\_COARSE\_LIMIT[3:0] bits. Refer to [Table 11](#).

**Table 10: Coarse Phase Limit Programming (the selected input clock of 2 kHz, 4 kHz or 8 kHz)**

MULTI_PH_8K_4K_2K_EN	WIDE_EN	Coarse Phase Limit
0	don't-care	±1 UI
1	0	±1 UI
	1	set by the PH_LOS_COARSE_LIMIT[3:0] bits

**Table 11: Coarse Phase Limit Programming (the selected input clock of other than 2 kHz, 4 kHz and 8 kHz)**

WIDE_EN	Coarse Phase Limit
0	±1 UI
1	set by the PH_LOS_COARSE_LIMIT[3:0] bits

The occurrence of the coarse phase loss will result in T0 DPLL unlocked if the COARSE\_PH\_LOS\_LIMIT\_EN bit is '1'.

##### 3.7.1.3 Fine Phase Loss

The T0 DPLL compares the selected input clock with the feedback signal. If the phase-compared result exceeds the fine phase limit pro-

grammed by the PH\_LOS\_FINE\_LIMIT[2:0] bits, a fine phase loss is triggered. It is cleared once the phase-compared result is within the fine phase limit.

The occurrence of the fine phase loss will result in T0 DPLL unlocked if the FINE\_PH\_LOS\_LIMIT\_EN bit is '1'.

##### 3.7.1.4 Hard Limit Exceeding

Two limits are available for this monitoring. They are DPLL soft limit and DPLL hard limit. When the frequency of the DPLL output with respect to the master clock exceeds the DPLL soft / hard limit, a DPLL soft / hard alarm will be raised; the alarm is cleared once the frequency is within the corresponding limit. The occurrence of the DPLL soft alarm does not affect the T0 DPLL locking status. The DPLL soft alarm is indicated by the corresponding T0\_DPLL\_SOFT\_FREQ\_ALARM bit. The occurrence of the DPLL hard alarm will result in T0 DPLL unlocked if the FREQ\_LIMIT\_PH\_LOS bit is '1'.

The DPLL soft limit is set by the DPLL\_FREQ\_SOFT\_LIMIT[6:0] bits and can be calculated as follows:

$$DPLL \text{ Soft Limit (ppm)} = DPLL\_FREQ\_SOFT\_LIMIT[6:0] \times 0.724$$

The DPLL hard limit is set by the DPLL\_FREQ\_HARD\_LIMIT[15:0] bits and can be calculated as follows:

$$DPLL \text{ Hard Limit (ppm)} = DPLL\_FREQ\_HARD\_LIMIT[15:0] \times 0.0014$$

#### 3.7.2 LOCKING STATUS

The DPLL locking status depends on the locking monitoring results. The DPLL is in locked state if none of the following events is triggered during 2 seconds; otherwise, the DPLL is unlocked.

- Fast Loss (the FAST\_LOS\_SW bit is '1');
- Coarse Phase Loss (the COARSE\_PH\_LOS\_LIMIT\_EN bit is '1');
- Fine Phase Loss (the FINE\_PH\_LOS\_LIMIT\_EN bit is '1');
- DPLL Hard Alarm (the FREQ\_LIMIT\_PH\_LOS bit is '1').

If the FAST\_LOS\_SW bit, the COARSE\_PH\_LOS\_LIMIT\_EN bit, the FINE\_PH\_LOS\_LIMIT\_EN bit or the FREQ\_LIMIT\_PH\_LOS bit is '0', the DPLL locking status will not be affected even if the corresponding event is triggered. If all these bits are '0', the DPLL will be in locked state in 2 seconds.

The DPLL locking status is indicated by the T0\_DPLL\_LOCK.

#### 3.7.3 PHASE LOCK ALARM

A phase lock alarm will be raised when the selected input clock can not be locked in T0 DPLL within a certain period. This period can be calculated as follows:

$$Period \text{ (sec.)} = TIME\_OUT\_VALUE[5:0] \times MULTI\_FACTOR[1:0]$$

The phase lock alarm is indicated by the corresponding INn\_CMOS\_PH\_LOCK\_ALARM bit (n = 1, 2 or 3) / INn\_DIFF\_PH\_LOCK\_ALARM bit (n = 1 or 2).

The phase lock alarm can be cleared by the following two ways, as selected by the PH\_ALARM\_TIMEOUT bit:

- Be cleared when a '1' is written to the corresponding `INn_CMOS_PH_LOCK_ALARM` / `INn_DIFF_PH_LOCK_ALARM` bit;
- Be cleared after the period ( $= \text{TIME\_OUT\_VALUE}[5:0] \times \text{MULTI\_FACTOR}[1:0]$  in second) which starts from when the alarm is raised.

The selected input clock with a phase lock alarm is disqualified for T0 DPLL locking.

### 3.8 SELECTED INPUT CLOCK SWITCH

If the input clock is selected by External Fast selection or by Forced selection, it can be switched by setting the related registers (refer to [Chapter 3.6.1 External Fast Selection](#) & [Chapter 3.6.2 Forced Selection](#)) any time. In this case, whether the input clock is qualified for DPLL locking does not affect the clock switch.

When the input clock is selected by Automatic selection, the input clock switch depends on its validity and priority. If the current selected input clock is disqualified, a new qualified input clock may be switched to.

#### 3.8.1 INPUT CLOCK VALIDITY

For all the input clocks, the validity depends on the results of input clock quality monitoring (refer to [Chapter 3.5 Input Clock Quality Monitoring](#)). When all of the following conditions are satisfied, the input clock is valid; otherwise, it is invalid.

- No no-activity alarm (the INn\_CMOS\_NO\_ACTIVITY\_ALARM / INn\_DIFF\_NO\_ACTIVITY\_ALARM bit is '0');
- No frequency hard alarm (the INn\_CMOS\_FREQ\_HARD\_ALARM / INn\_DIFF\_FREQ\_HARD\_ALARM bit is '0');
- If the IN\_NOISE\_WINDOW bit is '1', all the edges of the input clock of 2 kHz, 4 kHz or 8 kHz drift inside ±5%; if the IN\_NOISE\_WINDOW bit is '0', this condition is ignored.

The T0 selected input clock is valid when all of the above and the following conditions are satisfied; otherwise, it is invalid.

- No phase lock alarm, i.e., the INn\_CMOS\_PH\_LOCK\_ALARM / INn\_DIFF\_PH\_LOCK\_ALARM bit is '0';
- If the ULTR\_FAST\_SW bit is '1', the T0 selected input clock misses less than (<) 2 consecutive clock cycles; if the ULTR\_FAST\_SW bit is '0', this condition is ignored.

The validities of all the input clocks are indicated by the INn\_CMOS<sup>1</sup> bit (n = 1, 2 or 3) / INn\_DIFF<sup>1</sup> bit (n = 1 or 2). When the input clock validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid'), the INn\_CMOS<sup>2</sup> / INn\_DIFF<sup>2</sup> bit will be set. If the INn\_CMOS<sup>3</sup> / INn\_DIFF<sup>3</sup> bit is '1', an interrupt will be generated.

When the T0 selected input clock has failed, i.e., the validity of the T0 selected input clock changes from 'valid' to 'invalid', the T0\_MAIN\_REF\_FAILED<sup>1</sup> bit will be set. If the T0\_MAIN\_REF\_FAILED<sup>2</sup> bit is '1', an interrupt will be generated. This interrupt can also be indicated by hardware - the TDO pin, as determined by the LOS\_FLAG\_TO\_TDO bit. When the TDO pin is used to indicate this interrupt, it will be set high when this interrupt is generated and will remain high until this interrupt is cleared.

#### 3.8.2 SELECTED INPUT CLOCK SWITCH

Revertive and Non-Revertive switches are supported, as selected by the REVERTIVE\_MODE bit.

The difference between Revertive and Non-Revertive switches is that whether the selected input clock is switched when another qualified input clock with a higher priority than the current selected input clock is

available for selection. In Non-Revertive switch, input clock switch is minimized.

Conditions of the qualified input clocks available for T0 selection are as shown in [Table 13](#):

**Table 13: Conditions of Qualified Input Clocks Available for T0 Selection**

Conditions of Qualified Input Clocks Available for T0 Selection	
T0	<ul style="list-style-type: none"> <li>• Valid, i.e., the INn_CMOS<sup>1</sup> / INn_DIFF<sup>1</sup> bit is '1';</li> <li>• Priority enabled, i.e., the corresponding INn_CMOS_SEL_PRIORITY[3:0] / INn_DIFF_SEL_PRIORITY[3:0] bits are not '0000'</li> </ul>

The input clock is disqualified if any of the above conditions is not satisfied.

In summary, the selected input clock can be switched by:

- External Fast selection;
- Forced selection;
- Revertive switch;
- Non-Revertive switch;

#### 3.8.2.1 Revertive Switch

In Revertive switch, the selected input clock is switched when another qualified input clock with a higher priority than the current selected input clock is available.

The selected input clock is switched if any of the following is satisfied:

- the selected input clock is disqualified;
- another qualified input clock with a higher priority than the selected input clock is available.

A qualified input clock with the highest priority is selected by revertive switch. If more than one qualified input clock is available and has the same priority, the input clock with the smallest 'n' is selected. See [Table 8](#) for the 'n' assigned to each input clock.

#### 3.8.2.2 Non-Revertive Switch

In Non-Revertive switch, the T0 selected input clock is not switched when another qualified input clock with a higher priority than the current selected input clock is available. In this case, the selected input clock is switched and a qualified input clock with the highest priority is selected only when the T0 selected input clock is disqualified. If more than one qualified input clock is available and has the same priority, the input clock with the smallest 'n' is selected. See [Table 8](#) for the 'n' assigned to each input clock.

### 3.8.3 SELECTED / QUALIFIED INPUT CLOCKS INDICATION

The selected input clock is indicated by the CURRENTLY\_SELECTED\_INPUT[3:0] bits.

The qualified input clocks with the three highest priorities are indicated by HIGHEST\_PRIORITY\_VALIDATED[3:0] bits, the SECOND\_PRIORITY\_VALIDATED[3:0] bits and the THIRD\_PRIORITY\_VALIDATED[3:0] bits respectively. If more than one input clock has the same priority, the input clock with the smallest 'n' is indicated by the

HIGHEST\_PRIORITY\_VALIDATED[3:0] bits. See [Table 8](#) for the 'n' assigned to the input clock.

When the device is configured in Automatic selection and Revertive switch is enabled, the input clock indicated by the

CURRENTLY\_SELECTED\_INPUT[3:0] bits is the same as the one indicated by the HIGHEST\_PRIORITY\_VALIDATED[3:0] bits; otherwise, they are not the same.

### 3.9 SELECTED INPUT CLOCK STATUS VS. DPLL OPERATING MODE

T0 DPLL supports three primary operating modes: Free-Run, Locked and Holdover, and three secondary, temporary operating modes: Pre-Locked, Pre-Locked2 and Lost-Phase.

When the operating mode is switched by force, the operating mode switch is under external control and the status of the selected input clock takes no effect to the operating mode selection. The forced operating mode switch is applicable for special cases, such as testing.

When the operating mode is switched automatically, the internal state machines for T0 automatically determine the operating mode respectively.

#### 3.9.1 T0 SELECTED INPUT CLOCK VS. DPLL OPERATING MODE

The T0 DPLL operating mode is controlled by the T0\_OPERATING\_MODE[2:0] bits, as shown in Table 15:

Table 15: T0 DPLL Operating Mode Control

T0_OPERATING_MODE[2:0]	T0 DPLL Operating Mode
000	Automatic
001	Forced - Free-Run
010	Forced - Holdover
100	Forced - Locked
101	Forced - Pre-Locked2
110	Forced - Pre-Locked
111	Forced - Lost-Phase

When the operating mode is switched automatically, the operation of the internal state machine is shown in Figure 6.

Whether the operating mode is under external control or is switched automatically, the current operating mode is always indicated by the T0\_DPLL\_OPERATING\_MODE[2:0] bits. When the operating mode switches, the T0\_OPERATING\_MODE<sup>1</sup> bit will be set. If the T0\_OPERATING\_MODE<sup>2</sup> bit is '1', an interrupt will be generated.

The causes of Item 4, 9, 12, 15 - 'the T0 selected input clock is switched to another one' - are: (The T0 selected input clock is disqualified **AND** Another input clock is switched to) **OR** (In Revertive switch, a qualified input clock with a higher priority is switched to) **OR** (The T0 selected input clock is switched to another one by External Fast selection or Forced selection).

Refer to [Table 13](#) for details about the input clock qualification for T0 path.

### 3.10 DPLL OPERATING MODE

The DPLL gives a stable performance in different applications without being affected by operating conditions or silicon process variations. It integrates a PFD (Phase & Frequency Detector), a LPF (Low Pass Filter) and a DCO (Digital Controlled Oscillator), which forms a closed loop. If no input clock is selected, the loop is not closed, and the PFD and LPF do not function.

The PFD detects the phase error, including the fast loss, coarse phase loss and fine phase loss (refer to [Chapter 3.7.1.1 Fast Loss](#) to [Chapter 3.7.1.3 Fine Phase Loss](#)). The averaged phase error of the DPLL feedback with respect to the selected input clock is indicated by the CURRENT\_PH\_DATA[15:0] bits. It can be calculated as follows:

$$\text{Averaged Phase Error (ns)} = \text{CURRENT\_PH\_DATA}[15:0] \times 0.61$$

The LPF filters jitters. Its 3 dB bandwidth and damping factor are programmable. A range of bandwidths and damping factors can be set to meet different application requirements. Generally, the lower the damping factor is, the longer the locking time is and the more the gain is.

The DCO controls the DPLL output. The frequency of the DPLL output is always multiplied on the basis of the master clock. The phase and frequency offset of the DPLL output may be locked to those of the selected input clock. The current frequency offset with respect to the master clock is indicated by the CURRENT\_DPLL\_FREQ[23:0] bits, and can be calculated as follows:

$$\text{Current Frequency Offset (ppm)} = \text{CURRENT\_DPLL\_FREQ}[23:0] \times 0.000011$$

#### 3.10.1 T0 DPLL OPERATING MODE

The T0 DPLL loop is closed except in Free-Run mode and Holdover mode.

For a closed loop, different bandwidths and damping factors can be used depending on DPLL locking stages: starting, acquisition and locked.

In the first two seconds when the T0 DPLL attempts to lock to the selected input clock, the starting bandwidth and damping factor are used. They are set by the T0\_DPLL\_START\_BW[4:0] bits and the T0\_DPLL\_START\_DAMPING[2:0] bits respectively.

During the acquisition, the acquisition bandwidth and damping factor are used. They are set by the T0\_DPLL\_ACQ\_BW[4:0] bits and the T0\_DPLL\_ACQ\_DAMPING[2:0] bits respectively.

When the T0 selected input clock is locked, the locked bandwidth and damping factor are used. They are set by the T0\_DPLL\_LOCKED\_BW[4:0] bits and the T0\_DPLL\_LOCKED\_DAMPING[2:0] bits respectively.

The corresponding bandwidth and damping factor are used when the T0 DPLL operates in different DPLL locking stages: starting, acquisition and locked, as controlled by the device automatically.

Only the locked bandwidth and damping factor can be used regardless of the T0 DPLL locking stage, as controlled by the AUTO\_BW\_SEL bit.

#### 3.10.1.1 Free-Run Mode

In Free-Run mode, the T0 DPLL output refers to the master clock and is not affected by any input clock. The accuracy of the T0 DPLL output is equal to that of the master clock.

#### 3.10.1.2 Pre-Locked Mode

In Pre-Locked mode, the T0 DPLL output attempts to track the selected input clock.

The Pre-Locked mode is a secondary, temporary mode.

#### 3.10.1.3 Locked Mode

In Locked mode, the T0 selected input clock is locked. The phase and frequency offset of the T0 DPLL output track those of the T0 selected input clock.

In this mode, if the T0 selected input clock is in fast loss status and the FAST\_LOS\_SW bit is '1', the T0 DPLL is unlocked (refer to [Chapter 3.7.1.1 Fast Loss](#)) and will enter Lost-Phase mode when the operating mode is switched automatically; if the T0 selected input clock is in fast loss status and the FAST\_LOS\_SW bit is '0', the T0 DPLL locking status is not affected and the T0 DPLL will enter Temp-Holdover mode automatically.

##### 3.10.1.3.1 Temp-Holdover Mode

The T0 DPLL will automatically enter Temp-Holdover mode with a selected input clock switch or no qualified input clock available when the operating mode switch is under external control.

In Temp-Holdover mode, the T0 DPLL has temporarily lost the selected input clock. The T0 DPLL operation in Temp-Holdover mode and that in Holdover mode are alike (refer to [Chapter 3.10.1.5 Holdover Mode](#)) except the frequency offset acquiring methods. See [Chapter 3.10.1.5 Holdover Mode](#) for details about the methods. The method is selected by the TEMP\_HOLDOVER\_MODE[1:0] bits, as shown in [Table 16](#):

**Table 16: Frequency Offset Control in Temp-Holdover Mode**

TEMP_HOLDOVER_MODE[1:0]	Frequency Offset Acquiring Method
00	the same as that used in Holdover mode
01	Automatic Instantaneous
10	Automatic Fast Averaged
11	Automatic Slow Averaged

The device automatically controls the T0 DPLL to exit from Temp-Holdover mode.

#### 3.10.1.4 Lost-Phase Mode

In Lost-Phase mode, the T0 DPLL output attempts to track the selected input clock.

The Lost-Phase mode is a secondary, temporary mode.

#### 3.10.1.5 Holdover Mode

In Holdover mode, the T0 DPLL resorts to the stored frequency data acquired in Locked mode to control its output. The T0 DPLL output is not

phase locked to any input clock. The frequency offset acquiring method is selected by the MAN\_HOLD OVER bit, the AUTO\_AVG bit and the FAST\_AVG bit, as shown in [Table 17](#):

**Table 17: Frequency Offset Control in Holdover Mode**

MAN_HOLD OVER	AUTO_AVG	FAST_AVG	Frequency Offset Acquiring Method
0	0	don't-care	Automatic Instantaneous
	1	0	Automatic Slow Averaged
		1	Automatic Fast Averaged
1	don't-care		Manual

**3.10.1.5.1 Automatic Instantaneous**

By this method, the T0 DPLL freezes at the operating frequency when it enters Holdover mode. The accuracy is  $4.4 \times 10^{-8}$  ppm.

**3.10.1.5.2 Automatic Slow Averaged**

By this method, an internal IIR (Infinite Impulse Response) filter is employed to get the frequency offset. The IIR filter gives a 3 dB attenuation point corresponding to a period of 110 minutes. The accuracy is  $1.1 \times 10^{-5}$  ppm.

**3.10.1.5.3 Automatic Fast Averaged**

By this method, an internal IIR (Infinite Impulse Response) filter is employed to get the frequency offset. The IIR filter gives a 3 dB attenuation point corresponding to a period of 8 minutes. The accuracy is  $1.1 \times 10^{-5}$  ppm.

**3.10.1.5.4 Manual**

By this method, the frequency offset is set by the T0\_HOLD OVER\_FREQ[23:0] bits. The accuracy is  $1.1 \times 10^{-5}$  ppm.

The frequency offset of the T0 DPLL output is indicated by the CURRENT\_DPLL\_FREQ[23:0] bits.

The device provides a reference for the value to be written to the T0\_HOLD OVER\_FREQ[23:0] bits. The value to be written can refer to the value read from the CURRENT\_DPLL\_FREQ[23:0] bits or the T0\_HOLD OVER\_FREQ[23:0] bits (refer to [Chapter 3.10.1.5.5 Holdover](#)

[Frequency Offset Read](#)); or then be processed by external software filtering.

**3.10.1.5.5 Holdover Frequency Offset Read**

The offset value, which is acquired by Automatic Slow Averaged, Automatic Fast Averaged and is set by related register bits, can be read from the T0\_HOLD OVER\_FREQ[23:0] bits by setting the READ\_AVG bit and the FAST\_AVG bit, as shown in [Table 18](#).

**Table 18: Holdover Frequency Offset Read**

READ_AVG	FAST_AVG	Offset Value Read from T0_HOLD OVER_FREQ[23:0]
0	don't-care	The value is equal to the one written to.
1	0	The value is acquired by Automatic Slow Averaged method, not equal to the one written to.
	1	The value is acquired by Automatic Fast Averaged method, not equal to the one written to.

The frequency offset in ppm is calculated as follows:

$$\text{Holdover Frequency Offset (ppm)} = T0\_HOLD OVER\_FREQ[23:0] \times 0.000011$$

**3.10.1.6 Pre-Locked2 Mode**

In Pre-Locked2 mode, the T0 DPLL output attempts to track the selected input clock.

The Pre-Locked2 mode is a secondary, temporary mode.

### 3.11 DPLL OUTPUT

The DPLL output is locked to the selected input clock. According to the phase-compared result of the feedback and the selected input clock, and the DPLL output frequency offset, the PFD output is limited and the DPLL output is frequency offset limited.

#### 3.11.1 PFD OUTPUT LIMIT

The PFD output is limited to be within  $\pm 1$  UI or within the coarse phase limit (refer to [Chapter 3.7.1.2 Coarse Phase Loss](#)), as determined by the MULTI\_PH\_APP bit.

#### 3.11.2 FREQUENCY OFFSET LIMIT

The DPLL output is limited to be within the DPLL hard limit (refer to [Chapter 3.7.1.4 Hard Limit Exceeding](#)).

For T0 DPLL, the integral path value can be frozen when the DPLL hard limit is reached. This function, enabled by the T0\_LIMT bit, will minimize the subsequent overshoot when T0 DPLL is pulling in.

#### 3.11.3 PBO

The PBO function is only supported by the T0 path.

When a PBO event is triggered, the phase offset of the selected input clock with respect to the T0 DPLL output is measured. The device then automatically accounts for the measured phase offset and compensates an appropriate phase offset into the DPLL output so that the phase transients on the T0 DPLL output are minimized.

A PBO event is triggered if any one of the following conditions occurs:

- T0 selected input clock switches (the PBO\_EN bit is '1');
- T0 DPLL exits from Holdover mode or Free-Run mode (the PBO\_EN bit is '1');
- Phase-time changes on the T0 selected input clock are greater than a programmable limit over an interval of less than 0.1 seconds (the PH\_MON\_PBO\_EN bit is '1').

For the first two conditions, the phase transients on the T0 DPLL output are minimized to be no more than 0.61 ns with PBO. The PBO can also be frozen at the current phase offset by setting the PBO\_FREZ bit. When the PBO is frozen, the device will ignore any further PBO events triggered by the above two conditions, and maintain the current phase offset. When the PBO is disabled, there may be a phase shift on the T0 DPLL output and the T0 DPLL output tracks back to 0 degree phase offset with respect to the T0 selected input clock.

The last condition is specially for stratum 2 and 3E clocks. The PBO requirement specified in the Telcordia GR-1244-CORE is: 'Input phase-time changes of 3.5  $\mu$ s or greater over an interval of less than 0.1 seconds or less shall be built-out by stratum 2 and 3E clocks to reduce the resulting clock phase-time change to less than 50 ns. Phase-time

changes of 1.0  $\mu$ s or less over an interval of 0.1 seconds shall not be built-out.' Based on this requirement, phase-time changes of more than 1.0  $\mu$ s but less than 3.5  $\mu$ s that occur over an interval of less than 0.1 seconds may or may not be built-out.

An integrated Phase Transient Monitor can be enabled by the PH\_MON\_EN bit to monitor the phase-time changes on the T0 selected input clock. When the phase-time changes are greater than a limit over an interval of less than 0.1 seconds, a PBO event is triggered and the phase transients on the DPLL output are absorbed. The limit is programmed by the PH\_TR\_MON\_LIMT[3:0] bits, and can be calculated as follows:

$$\text{Limit (ns)} = (\text{PH\_TR\_MON\_LIMT}[3:0] + 7) \times 156$$

The phase offset induced by PBO will never result in a coarse or fine phase loss.

#### 3.11.4 PHASE OFFSET SELECTION

The phase offset of the T0 selected input clock with respect to the T0 DPLL output can be adjusted. The PH\_OFFSET\_EN bit determines whether the input-to-output phase offset is enabled. If enabled, the input-to-output phase offset can be adjusted by setting the PH\_OFFSET[9:0] bits.

The input-to-output phase offset can be calculated as follows:

$$\text{Phase Offset (ns)} = \text{PH\_OFFSET}[9:0] \times 0.61$$

#### 3.11.5 FOUR PATHS OF T0 DPLL OUTPUTS

The T0 DPLL output are phase aligned with the T0 selected input clock respectively every 125  $\mu$ s period. Each DPLL has four output paths.

##### 3.11.5.1 T0 Path

The four paths for T0 DPLL output are as follows:

- 77.76 MHz path - outputs a 77.76 MHz clock;
- 16E1/16T1 path - outputs a 16E1 or 16T1 clock, as selected by the IN\_SONET\_SDH bit;
- ETH/OBSAI/16E1/16T1 path - outputs a ETH, OBSAI, 16E1 or 16T1 clock, as selected by the T0\_ETH\_OBSAI\_16E1\_16T1\_SEL[1:0] bits;
- 12E1/24T1/E3/T3 path - outputs a 12E1, 24T1, E3 or T3 clock, as selected by the T0\_12E1\_24T1\_E3\_T3\_SEL[1:0] bits.

T0 selected input clock is compared with a T0 DPLL output for DPLL locking. The output can only be derived from the 77.76 MHz path or the 16E1/16T1 path. The output path is automatically selected and the output is automatically divided to get the same frequency as the T0 selected input clock.

T0 DPLL outputs are provided for T0/T4 APLL or device output process.

### 3.12 T0 / T4 APLL

A T0 APLL and a T4 APLL are provided for a better jitter and wander performance of the device output clocks.

The bandwidths of the T0/T4 APLL are set by the T0\_APLL\_BW[1:0] / T4\_APLL\_BW[1:0] bits respectively. The lower the bandwidth is, the better the jitter and wander performance of the T0/T4 APLL output are.

The input of the T0/T4 APLL can be derived from the T0 DPLL outputs, as selected by the T0\_APLL\_PATH[3:0] / T4\_APLL\_PATH[3:0] bits respectively.

Both the APLL and DPLL outputs are provided for selection for the device output.

**Table 19: Related Bit / Register in Chapter 3.12**

Bit	Register	Address (Hex)

### 3.13 OUTPUT CLOCKS & FRAME SYNC SIGNALS

The device supports 2 output clocks and 2 frame sync output signals altogether.

#### 3.13.1 OUTPUT CLOCKS

The device provides 2 output clocks.

OUT1 outputs a PECL or LVDS signal, as selected by the OUT1\_PECL\_LVDS bit. OUT2 outputs a CMOS signal.

The outputs on OUT1 and OUT2 are variable, depending on the signals derived from the T0 DPLL and T0/T4 APLL outputs, and the corresponding OUTn\_PATH\_SEL[3:0] bits (n = 1 or 2). The derived signal can be from the T0 DPLL and T0/T4 APLL outputs, as selected by the corresponding OUTn\_PATH\_SEL[3:0] bits (n = 1 or 2). If the signal is derived from one of the T0 DPLL outputs, please refer to [Table 20](#) for the output frequency. If the signal is derived from the T0/T4 APLL output, please refer to [Table 21~Table 22](#) for the output frequency.

The outputs on OUT1 and OUT2 can be inverted, as determined by the corresponding OUTn\_INV bit (n = 1 or 2).

Both the output clocks derived from T0/T4 selected input clock are aligned with the T0/T4 selected input clock respectively every 125 µs period.

2. In the APLL, the selected T0 DPLL output may be multiplied. E1 = 2.048 MHz, T1 = 1.544 MHz, E3 = 34.368 MHz, T3 = 44.736 MHz. The blank cell means the configuration is reserved.  
3. The 622.08 MHz and 311.04 MHz differential signals are only output on OUT1.

**3.13.2 FRAME SYNC OUTPUT SIGNALS**

An 8 kHz and a 2 kHz frame sync signals are output on the FRSYNC\_8K and MFRSYNC\_2K pins if enabled by the 8K\_EN and 2K\_EN bits respectively. They are CMOS outputs.

The two frame sync signals are derived from the T0 APLL output and are aligned with the output clock. They can be synchronized to one of the three frame sync input signals.

One of the three frame sync input signals is selected, as determined by the SYNC\_BYPASS bit and the T0 selected input clock, as shown in Table 23:

**Table 23: Frame Sync Input Signal Selection**

SYNC_BYPASS	T0 Selected Input Clock	Selected Frame Sync Input Signal
0	don't-care	EX_SYNC1
1	IN1_CMOS or IN1_DIFF	EX_SYNC1
	IN2_CMOS or IN2_DIFF	EX_SYNC2
	IN3_CMOS	EX_SYNC3
	none	none

If the selected frame sync input signal with respect to the T0 selected input clock is above a limit set by the SYNC\_MON\_LIMT[2:0] bits, an external sync alarm will be raised and the selected frame sync input signal is disabled to synchronize the frame sync output signals. The external sync alarm is cleared once the selected frame sync input signal with respect to the T0 selected input clock is within the limit. If it is within the

**Table 24: Synchronization Control**

SYNC_BYPASS	AUTO_EXT_SYNC_EN	EXT_SYNC_EN	Synchronization

limit, whether the selected frame sync input signal is enabled to synchronize the frame sync output signal is determined by the SYNC\_BYPASS bit, the AUTO\_EXT\_SYNC\_EN bit and the EXT\_SYNC\_EN bit. Refer to Table 24 for details.

When the selected frame sync input signal is enabled to synchronize the frame sync output signal, it should be adjusted to align itself with the T0 selected input clock. Nominally, the falling edge of the selected frame sync input signal is aligned with the rising edge of the T0 selected input clock. The selected frame sync input signal may be 0.5 UI early/late or 1 UI late due to the circuit and board wiring delays. Setting the sampling of the selected frame sync input signal by the SYNC\_PHN[1:0] bits (n = 1, 2 or 3 corresponding to EX\_SYNC1, EX\_SYNC2 or EX\_SYNC3 respectively) will compensate this early/late. Refer to Figure 7 to Figure 10.

The EX\_SYNC\_ALARM\_MON bit indicates whether the selected frame sync input signal is in external sync alarm status. The external sync alarm is indicated by the EX\_SYNC\_ALARM<sup>1</sup> bit. If the EX\_SYNC\_ALARM<sup>2</sup> bit is '1', the occurrence of the external sync alarm will trigger an interrupt.

The 8 kHz and the 2 kHz frame sync output signals can be inverted by setting the 8K\_INV and 2K\_INV bits respectively. The frame sync outputs can be 50:50 duty cycle or pulsed, as determined by the 8K\_PUL and 2K\_PUL bits respectively. When they are pulsed, the pulse width is defined by the period of OUT2; and they are pulsed on the position of the falling or rising edge of the standard 50:50 duty cycle, as selected by the 2K\_8K\_PUL\_POSITION bit.

### 3.14 INTERRUPT SUMMARY

The interrupt sources of the device are as follows:

- Input clocks for T0 path validity change
- T0 selected input clock fail
- T0 DPLL operating mode switch
- External sync alarm

All of the above interrupt events are indicated by the corresponding interrupt status bit. If the corresponding interrupt enable bit is set, any of the interrupts can be reported by the INT\_REQ pin. The output characteristics on the INT\_REQ pin are determined by the HZ\_EN bit and the INT\_POL bit.

Interrupt events are cleared by writing a '1' to the corresponding interrupt status bit. The INT\_REQ pin will be inactive only when all the pending enabled interrupts are cleared.

In addition, the interrupt of T0 selected input clock fail can be reported by the TDO pin, as determined by the LOS\_FLAG\_TO\_TDO bit.

### 3.15 T0 SUMMARY

The main features supported by the T0 path are as follows:

- Phase lock alarm;
- Forced or Automatic input clock selection/switch;
- 3 primary and 3 secondary, temporary DPLL operating modes, switched automatically or under external control;
- Automatic switch between starting, acquisition and locked bandwidths/damping factors;
- Programmable DPLL bandwidths from 0.1 Hz to 560 Hz in 11 steps;
- Programmable damping factors: 1.2, 2.5, 5, 10 and 20;
- Fast loss, coarse phase loss, fine phase loss and hard limit exceeding monitoring;
- Output phase and frequency offset limited;
- Automatic Instantaneous, Automatic Slow Averaged, Automatic Fast Averaged or Manual holdover frequency offset acquiring;
- PBO to minimize output phase transients;
- Programmable output phase offset;
- Low jitter multiple clock outputs with programmable polarity;
- Low jitter 2 kHz and 8 kHz frame sync signal outputs with programmable pulse width and polarity.

### 3.16 POWER SUPPLY FILTERING TECHNIQUES

**Figure 11. IDT82V3352 Power Decoupling Scheme**

To achieve optimum jitter performance, power supply filtering is required to minimize supply noise modulation of the output clocks. The common sources of power supply noise are switch power supplies and the high switching noise from the outputs to the internal PLL. The IDT82V3352 provides separate VDDA power pins for the internal analog PLL, VDD\_DIFF for the differential output driver circuit and VDDD pins for the core logic as well as I/O driver circuits.

To minimize switching power supply noise generated by the switching regulator, the power supply output should be filtering with sufficient bulk capacity to minimize ripple and 0.1 uF (0402 case size, ceramic) caps to filter out the switching transients.

For the IDT82V3352, the decoupling for VDDA, VDD\_DIFF and VDDD are handled individually. VDDD, VDD\_DIFF and VDDA should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. Figure 12 illustrated how bypass capacitor and ferrite bead should be connected to power pins.

The analog power supply VDDA and VDD\_DIFF should have low impedance. This can be achieved by using one 10 uF (1210 case size, ceramic) and at least four 0.1 uF (0402 case size, ceramic) capacitors in parallel. The 0.1 uF (0402 case size, ceramic) capacitors must be placed right next to the VDDA and VDD\_DIFF pins as close as possible. Note that the 10 uF capacitor must be of 1210 case size, and it must be ceramic for lowest ESR (Effective Series Resistance) possible. The 0.1 uF should be of case size 0402, this offers the lowest ESL (Effective Series Inductance) to achieve low impedance towards the high speed range.

For VDDD, at least ten 0.1 uF (0402 case size, ceramic) and one 10 uF (1210 case size, ceramic) capacitors are recommended. The 0.1 uF capacitors should be placed as close to the VDDD pins as possible.

Please refer to evaluation board schematic for details.

## 4 MICROPROCESSOR INTERFACE

The microprocessor interface provides access to read and write the registers in the device. The microprocessor interface supports Serial mode only.

In a read operation, the active edge of SCLK is selected by CLKE. When CLKE is asserted low, data on SDO will be clocked out on the ris-

ing edge of SCLK. When CLKE is asserted high, data on SDO will be clocked out on the falling edge of SCLK.

In a write operation, data on SDI will be clocked in on the rising edge of SCLK.

## 5 JTAG

This device is compliant with the IEEE 1149.1 Boundary Scan standard except the following:

- The output boundary scan cells do not capture data from the core and the device does not support EXTEST instruction;
- The  $\overline{\text{TRST}}$  pin is set low by default and JTAG is disabled in order to be consistent with other manufacturers.

The JTAG interface timing diagram is shown in [Figure 16](#).

## 6 PROGRAMMING INFORMATION

After reset, all the registers are set to their default values. The registers are read or written via the microprocessor interface.

Before any write operation, the value in register PROTECTION\_CNFG is recommended to be confirmed to make sure whether the write operation is enabled. The device provides 3 register protection modes:

- Protected mode: no other registers can be written except register PROTECTION\_CNFG itself;
- Fully Unprotected mode: all the writable registers can be written;
- Single Unprotected mode: one more register can be written besides register PROTECTION\_CNFG. After write operation (not including writing a '1' to clear a bit to '0'), the device automatically switches to Protected mode.

Writing '0' to the registers will take no effect if the registers are cleared by writing '1'.

The access of the Multi-word Registers is different from that of the Single-word Registers. Take the registers (04H, 05H and 06H) for an

example, the write operation for the Multi-word Registers follows a fixed sequence. The register (04H) is configured first and the register (06H) is configured last. The three registers are configured continuously and should not be interrupted by any operation. The crystal calibration configuration will take effect after all the three registers are configured. During read operation, the register (04H) is read first and the register (06H) is read last. The crystal calibration reading should be continuous and not be interrupted by any operation.

Certain bit locations within the device register map are designated as Reserved. To ensure proper and predictable operation, bits designated as Reserved should not be written by the users. In addition, their value should be masked out from any testing or error detection methods that are implemented.

## 6.2 REGISTER DESCRIPTION

### 6.2.1 GLOBAL CONTROL REGISTERS

#### ID[7:0] - Device ID 1

Address: 00H Type: Read Default Value: 10001000							
7	6	5	4	3	2	1	0
ID7	ID6	ID5	ID4	ID3	ID2	ID1	ID0
Bit	Name	Description					
7 - 0	ID[7:0]	Refer to the description of the ID[15:8] bits (b7~0, 01H).					

#### ID[15:8] - Device ID 2

Address: 01H Type: Read Default Value: 00010001							
7	6	5	4	3	2	1	0
ID15	ID14	ID13	ID12	ID11	ID10	ID9	ID8
Bit	Name	Description					
7 - 0	ID[15:8]	The value in the ID[15:0] bits are pre-set, representing the identification number for the IDT82V3352.					

#### NOMINAL\_FREQ[7:0]\_CNFG - Crystal Oscillator Frequency Offset Calibration Configuration 1

Address: 04H Type: Read / Write Default Value: 00000000							
7	6	5	4	3	2	1	0
NOMINAL_FREQ_VALUE7	NOMINAL_FREQ_VALUE6	NOMINAL_FREQ_VALUE5	NOMINAL_FREQ_VALUE4	NOMINAL_FREQ_VALUE3	NOMINAL_FREQ_VALUE2	NOMINAL_FREQ_VALUE1	NOMINAL_FREQ_VALUE0
Bit	Name	Description					
7 - 0	NOMINAL_FREQ_VALUE[7:0]	Refer to the description of the NOMINAL_FREQ_VALUE[23:16] bits (b7~0, 06H).					

**NOMINAL\_FREQ[15:8]\_CNFG - Crystal Oscillator Frequency Offset Calibration Configuration 2**

Address: 05H							
Type: Read / Write							
Default Value: 00000000							
7	6	5	4	3	2	1	0
NOMINAL_FREQ_VALUE15	NOMINAL_FREQ_VALUE14	NOMINAL_FREQ_VALUE13	NOMINAL_FREQ_VALUE12	NOMINAL_FREQ_VALUE11	NOMINAL_FREQ_VALUE10	NOMINAL_FREQ_VALUE9	NOMINAL_FREQ_VALUE8
Bit	Name	Description					
7 - 0	NOMINAL_FREQ_VALUE[15:8]	Refer to the description of the NOMINAL_FREQ_VALUE[23:16] bits (b7~0, 06H).					

**NOMINAL\_FREQ[23:16]\_CNFG - Crystal Oscillator Frequency Offset Calibration Configuration 3**

Address: 06H							
Type: Read / Write							
Default Value: 00000000							
7	6	5	4	3	2	1	0
NOMINAL_FREQ_VALUE23	NOMINAL_FREQ_VALUE22	NOMINAL_FREQ_VALUE21	NOMINAL_FREQ_VALUE20	NOMINAL_FREQ_VALUE19	NOMINAL_FREQ_VALUE18	NOMINAL_FREQ_VALUE17	NOMINAL_FREQ_VALUE16
Bit	Name	Description					
7 - 0	NOMINAL_FREQ_VALUE[23:16]	<p>The NOMINAL_FREQ_VALUE[23:0] bits represent a 2's complement signed integer. If the value is multiplied by 0.0000884, the calibration value for the master clock in ppm will be gotten.</p> <p>For example, the frequency offset on OSC1 is +3 ppm. Though -3 ppm should be compensated, the calibration value is calculated as +3 ppm:</p> <p><math>3 \div 0.0000884 = 33937</math> (Dec.) = 8490 (Hex);</p> <p>So '008490' should be written into these bits.</p> <p>The calibration range is within <math>\pm 741</math> ppm.</p>					

**PHASE\_ALARM\_TIME\_OUT\_CNFG - Phase Lock Alarm Time-Out Configuration**

Address: 08H							
Type: Read / Write							
Default Value: 00110010							
7	6	5	4	3	2	1	0
MULTI_FACTO R1	MULTI_FACTO R0	TIME_OUT_VA LUE5	TIME_OUT_VA LUE4	TIME_OUT_VA LUE3	TIME_OUT_VA LUE2	TIME_OUT_VA LUE1	TIME_OUT_VAL UE0
Bit	Name	Description					
7 - 6	MULTI_FACTOR[1:0]	<p>These bits determine a factor which has a relationship with a period in seconds. A phase lock alarm will be raised if the T0 selected input clock is not locked in T0 DPLL within this period. If the PH_ALARM_TIMEOUT bit (b5, 09H) is '1', the phase lock alarm will be cleared after this period (starting from when the alarm is raised). Refer to the description of the TIME_OUT_VALUE[5:0] bits (b5~0, 08H).</p> <p>00: 2 (default) 01: 4 10: 8 11: 16</p>					
5 - 0	TIME_OUT_VALUE[5:0]	<p>These bits represent an unsigned integer. If the value in these bits is multiplied by the value in the MULTI_FACTOR[1:0] bits (b7~6, 08H), a period in seconds will be gotten.</p> <p>A phase lock alarm will be raised if the T0 selected input clock is not locked in T0 DPLL within this period. If the PH_ALARM_TIMEOUT bit (b5, 09H) is '1', the phase lock alarm will be cleared after this period (starting from when the alarm is raised).</p>					

**INPUT\_MODE\_CNFG - Input Mode Configuration**

Address: 09H																			
Type: Read / Write																			
Default Value: 10100X10																			
7	6	5	4	3	2	1	0												
AUTO_EXT_SYNC_EN	EXT_SYNC_EN	PH_ALARM_TIMEOUT	SYNC_FREQ1	SYNC_FREQ0	IN_SONET_SDH	-	REVERTIVE_MODE												
Bit	Name	Description																	
7	AUTO_EXT_SYNC_EN	This bit is valid only when the SYNC_BYPASS bit (b7, 7CH) is '0'. Refer to the description of the EXT_SYNC_EN bit (b6, 09H).																	
6	EXT_SYNC_EN	<p>This bit is valid only when the SYNC_BYPASS bit (b7, 7CH) is '0'. This bit, together with the AUTO_EXT_SYNC_EN bit (b7, 09H), determines whether the selected frame sync input signal is enabled to synchronize the frame sync output signals.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>AUTO_EXT_SYNC_EN</th> <th>EXT_SYNC_EN</th> <th>Synchronization</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">don't-care</td> <td style="text-align: center;">0</td> <td style="text-align: center;">Disabled (default)</td> </tr> <tr> <td style="text-align: center;">0</td> <td style="text-align: center;">1</td> <td style="text-align: center;">Enabled</td> </tr> <tr> <td style="text-align: center;">1</td> <td style="text-align: center;">1</td> <td style="text-align: center;">Disabled</td> </tr> </tbody> </table>						AUTO_EXT_SYNC_EN	EXT_SYNC_EN	Synchronization	don't-care	0	Disabled (default)	0	1	Enabled	1	1	Disabled
AUTO_EXT_SYNC_EN	EXT_SYNC_EN	Synchronization																	
don't-care	0	Disabled (default)																	
0	1	Enabled																	
1	1	Disabled																	
5	PH_ALARM_TIMEOUT	<p>This bit determines how to clear the phase lock alarm.</p> <p>0: The phase lock alarm will be cleared when a '1' is written to the corresponding INn_CMOS_PH_LOCK_ALARM (n = 1, 2 or 3) / INn_DIFF_PH_LOCK_ALARM (n = 1 or 2) bit (b4/0, 44H/45H/47H).</p> <p>1: The phase lock alarm will be cleared after a period (= <i>TIME_OUT_VALUE</i>[5:0] (b5~0, 08H) X <i>MULTI_FACTOR</i>[1:0] (b7~6, 08H) in second) which starts from when the alarm is raised. (default)</p>																	
4 - 3	SYNC_FREQ[1:0]	<p>These bits set the frequency of the frame sync signals input on the EX_SYNC1 ~ EX_SYNC3 pins.</p> <p>00: 8 kHz (default)                      01: 8 kHz.                      10: 4 kHz.                      11: 2 kHz.</p>																	
2	IN_SONET_SDH	<p>This bit selects the SDH or SONET network type.</p> <p>0: SDH. The DPLL required clock is 2.048 MHz when the IN_FREQ[3:0] bits (b3~0, 16H, 17H, 19H, 1AH &amp; 1DH) are '0001' and the T0 DPLL output from the 16E1/16T1 path is 16E1.</p> <p>1: SONET. The DPLL required clock is 1.544 MHz when the IN_FREQ[3:0] bits (b3~0, 16H, 17H, 19H, 1AH &amp; 1DH) are '0001' and the T0 DPLL output from the 16E1/16T1 path is 16T1.</p> <p>The default value of this bit is determined by the SONET/SDH pin during reset.</p>																	
1	-	Reserved.																	
0	REVERTIVE_MODE	<p>This bit selects Revertive or Non-Revertive switch for T0 path.</p> <p>0: Non-Revertive switch. (default)                      1: Revertive switch.</p>																	

## DIFFERENTIAL\_IN\_OUT\_OSCI\_CNFG - Differential Input / Output Port &amp; Master Clock Configuration

Address: 0AH							
Type: Read / Write							
Default Value: XXXXX00X							
7	6	5	4	3	2	1	0
-	-	-	-	-	OSC_EDGE	OUT1_PECL_LVDS	-
Bit	Name	Description					
7-3	-	Reserved.					
2	OSC_EDGE	This bit selects a better active edge of the master clock. 0: The rising edge. (default) 1: The falling edge.					
1	OUT1_PECL_LVDS	This bit selects a port technology for OUT1. 0: LVDS. (default) 1: PECL.					
0	-	Reserved					

## MON\_SW\_PBO\_CNFG - Frequency Monitor, Input Clock Selection &amp; PBO Control

Address: 0BH							
Type: Read / Write							
Default Value: 100X01X1							
7	6	5	4	3	2	1	0
FREQ_MON_CLK	LOS_FLAG_TO_TDO	ULTR_FAST_SW	EXT_SW	PBO_FREZ	PBO_EN	-	FREQ_MON_HARD_EN
Bit	Name	Description					
7	FREQ_MON_CLK	The bit selects a reference clock for input clock frequency monitoring. 0: The output of T0 DPLL. 1: The master clock. (default)					
6	LOS_FLAG_TO_TDO	The bit determines whether the interrupt of T0 selected input clock fail - is reported by the TDO pin. 0: Not reported. TDO pin is used as JTAG test data output which complies with IEEE 1149.1. (default) 1: Reported. TDO pin mimics the state of the T0_MAIN_REF_FAILED bit (b6, 0EH) and does not strictly comply with IEEE 1149.1.					
5	ULTR_FAST_SW	This bit determines whether the T0 selected input clock is valid when missing 2 consecutive clock cycles or more. 0: Valid. (default) 1: Invalid.					
4	EXT_SW	This bit determines the T0 input clock selection. 0: Forced selection or Automatic selection, as controlled by the T0_INPUT_SEL[3:0] bits (b3~0, 50H). 1: External Fast selection. The default value of this bit is determined by the FF_SRCSW pin during reset.					
3	PBO_FREZ	This bit is valid only when the PBO is enabled by the PBO_EN bit (b2, 0BH). It determines whether PBO is frozen at the current phase offset when a PBO event is triggered. 0: Not frozen. (default) 1: Frozen. Further PBO events are ignored and the current phase offset is maintained.					
2	PBO_EN	This bit determines whether PBO is enabled when the T0 selected input clock switch or the T0 DPLL exiting from Holdover mode or Free-Run mode occurs. 0: Disabled. 1: Enabled. (default)					
1	-	Reserved.					
0	FREQ_MON_HARD_EN	This bit determines whether the frequency hard alarm is enabled when the frequency of the input clock with respect to the reference clock is above the frequency hard alarm threshold. The reference clock can be the output of T0 DPLL or the master clock, as determined by the FREQ_MON_CLK bit (b7, 0BH). 0: Disabled. 1: Enabled. (default)					

**PROTECTION\_CNFG - Register Protection Mode Configuration**

Address: 7EH							
Type: Read / Write							
Default Value: 10000101							
7	6	5	4	3	2	1	0
PROTECTION_ DATA7	PROTECTION_ DATA6	PROTECTION_ DATA5	PROTECTION_ DATA4	PROTECTION_ DATA3	PROTECTION_ DATA2	PROTECTION_ DATA1	PROTECTION_ DATA0
Bit	Name	Description					
7 - 0	PROTECTION_DATA[7:0]	<p>These bits select a register write protection mode.</p> <p>00000000 - 10000100, 10000111 - 11111111: Protected mode. No other registers can be written except this register.</p> <p>10000101: Fully Unprotected mode. All the writable registers can be written. (default)</p> <p>10000110: Single Unprotected mode. One more register can be written besides this register. After write operation (not including writing a '1' to clear the bit to '0'), the device automatically switches to Protected mode.</p>					

## 6.2.2 INTERRUPT REGISTERS

## INTERRUPT\_CNFG - Interrupt Configuration

Address: 0CH							
Type: Read / Write							
Default Value: XXXXXX10							
7	6	5	4	3	2	1	0
-	-	-	-	-	-	HZ_EN	INT_POL
Bit	Name	Description					
7 - 2	-	Reserved.					
1	HZ_EN	This bit determines the output characteristics of the INT_REQ pin. 0: The output on the INT_REQ pin is high/low when the interrupt is active; the output is the opposite when the interrupt is inactive. 1: The output on the INT_REQ pin is high/low when the interrupt is active; the output is in high impedance state when the interrupt is inactive. (default)					
0	INT_POL	This bit determines the active level on the INT_REQ pin for an active interrupt indication. 0: Active low. (default) 1: Active high.					

## INTERRUPTS1\_STS - Interrupt Status 1

Address: 0DH							
Type: Read / Write							
Default Value: XX1111XX							
7	6	5	4	3	2	1	0
-	-	IN2_DIFF	IN1_DIFF	IN2_CMOS	IN1_CMOS	-	-
Bit	Name	Description					
7 - 6	-	Reserved.					
5 - 4	INn_DIFF	This bit indicates the validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid') for the corresponding INn_DIFF; i.e., whether there is a transition (from '0' to '1' or from '1' to '0') on the corresponding INn_DIFF bit (b5/4, 4AH). Here n is 2 or 1. 0: Has not changed. 1: Has changed. (default) This bit is cleared by writing a '1'.					
3 - 2	INn_CMOS	This bit indicates the validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid') for the corresponding INn_CMOS; i.e., whether there is a transition (from '0' to '1' or from '1' to '0') on the corresponding INn_CMOS bit (b3/2, 4AH). Here n is 2 or 1. 0: Has not changed. 1: Has changed. (default) This bit is cleared by writing a '1'.					
1 - 0	-	Reserved.					

**INTERRUPTS2\_STS - Interrupt Status 2**

Address: 0EH  
 Type: Read / Write  
 Default Value: 00XXXXX1

7	6	5	4	3	2	1	0
T0_OPERATING_MODE	T0_MAIN_REF_FAILED	-	-	-	-	-	IN3_CMOS

Bit	Name	Description
7	T0_OPERATING_MODE	This bit indicates the operating mode switch for T0 DPLL; i.e., whether the value in the T0_DPLL_OPERATING_MODE[2:0] bits (b2~0, 52H) changes. 0: Has not switched. (default) 1: Has switched. This bit is cleared by writing a '1'.
6	T0_MAIN_REF_FAILED	This bit indicates whether the T0 selected input clock has failed. The T0 selected input clock fails when its validity changes from 'valid' to 'invalid'; i.e., when there is a transition from '1' to '0' on the corresponding INn_CMOS / INn_DIFF bit (4AH, 4BH). 0: Has not failed. (default) 1: Has failed. This bit is cleared by writing a '1'.
5-1	-	Reserved.
0	IN3_CMOS	This bit indicates the validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid') for IN3_CMOS for T0 path, i.e., whether there is a transition (from '0' to '1' or from '1' to '0') on the corresponding IN3_CMOS bit (b0, 4BH). 0: Has not changed. 1: Has changed. (default) This bit is cleared by writing a '1'.

**INTERRUPTS3\_STS - Interrupt Status 3**

Address: 0FH  
 Type: Read / Write  
 Default Value: 11X1XXXX

7	6	5	4	3	2	1	0
EX_SYNC_ALARM	-	-	-	-	-	-	-

Bit	Name	Description
7	EX_SYNC_ALARM	This bit indicates whether an external sync alarm is raised; i.e., whether there is a transition from '0' to '1' on the EX_SYNC_ALARM_MON bit (b7, 52H). 0: Has not occurred. 1: Has occurred. (default) This bit is cleared by writing a '1'.
6-0	-	Reserved.

**INTERRUPTS1\_ENABLE\_CNFG - Interrupt Control 1**

Address: 10H  
 Type: Read / Write  
 Default Value: XX0000XX

7	6	5	4	3	2	1	0
-	-	IN2_DIFF	IN1_DIFF	IN2_CMOS	IN1_CMOS	-	-

Bit	Name	Description
7 - 6	-	Reserved.
5 - 4	INn_DIFF	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when the input clock validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid'), i.e., when the corresponding INn_DIFF bit (b5/4, 0DH) is '1'. Here n is 2 or 1. 0: Disabled. (default) 1: Enabled.
3 - 2	INn_CMOS	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when the input clock validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid'), i.e., when the corresponding INn_CMOS bit (b3/2, 0DH) is '1'. Here n is 2 or 1. 0: Disabled. (default) 1: Enabled.
1 - 0	-	Reserved.

**INTERRUPTS2\_ENABLE\_CNFG - Interrupt Control 2**

Address: 11H  
 Type: Read / Write  
 Default Value: 00XXXXX0

7	6	5	4	3	2	1	0
T0_OPERATING_MODE	T0_MAIN_REF_FAILED	-	-	-	-	-	IN3_CMOS

Bit	Name	Description
7	T0_OPERATING_MODE	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when the T0 DPLL operating mode switches, i.e., when the T0_OPERATING_MODE bit (b7, 0EH) is '1'. 0: Disabled. (default) 1: Enabled.
6	T0_MAIN_REF_FAILED	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when the T0 selected input clock has failed; i.e., when the T0_MAIN_REF_FAILED bit (b6, 0EH) is '1'. 0: Disabled. (default) 1: Enabled.
5 - 1	-	Reserved.
0	IN3_CMOS	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when the input clock validity changes (from 'valid' to 'invalid' or from 'invalid' to 'valid'), i.e., when the corresponding IN3_CMOS bit (b0, 0EH) is '1'. 0: Disabled. (default) 1: Enabled.

**INTERRUPTS3\_ENABLE\_CNFG - Interrupt Control 3**

Address: 12H  
 Type: Read / Write  
 Default Value: 00X0XXXX

7	6	5	4	3	2	1	0
EX_SYNC_ALARM	-	-	-	-	-	-	-

Bit	Name	Description
7	EX_SYNC_ALARM	This bit controls whether the interrupt is enabled to be reported on the INT_REQ pin when an external sync alarm has occurred, i.e., when the EX_SYNC_ALARM bit (b7, 0FH) is '1'. 0: Disabled. (default) 1: Enabled.
6 - 0	-	Reserved.

6.2.3 INPUT CLOCK FREQUENCY & PRIORITY CONFIGURATION REGISTERS

IN1\_CMOS\_CNFG - CMOS Input Clock 1 Configuration

Address: 16H							
Type: Read / Write							
Default Value: 00000000							
7	6	5	4	3	2	1	0
DIRECT_DIV	LOCK_8K	BUCKET_SEL1	BUCKET_SEL0	IN_FREQ3	IN_FREQ2	IN_FREQ1	IN_FREQ0
Bit	Name	Description					
7	DIRECT_DIV	Refer to the description of the LOCK_8K bit (b6, 16H).					
6	LOCK_8K	This bit, together with the DIRECT_DIV bit (b7, 16H), determines whether the DivN Divider or the Lock 8k Divider is used for IN1_CMOS:					
		DIRECT_DIV bit	LOCK_8K bit	Used Divider			
		0	0	Both bypassed (default)			
		0	1	Lock 8k Divider

**PHASE\_LOSS\_COARSE\_LIMIT\_CNFG - Phase Loss Coarse Detector Limit Configuration \***

Address: 5AH  
 Type: Read / Write  
 Default Value: 10000101

Bit	Name	Description																					
7	COARSE_PH_LOS_LIMT_EN	This bit controls whether the occurrence of the coarse phase loss will result in the T0 DPLL unlocked. 0: Disabled. 1: Enabled. (default)																					
6	WIDE_EN	Refer to the description of the MULTI_PH_8K_4K_2K_EN bit (b4, 5AH).																					
5	MULTI_PH_APP	This bit determines whether the PFD output of T0 DPLL is limited to ±1 UI or is limited to the coarse phase limit. 0: Limited to ±1 UI. (default) 1: Limited to the coarse phase limit. When the selected input clock is of 2 kHz, 4 kHz or 8 kHz, the coarse phase limit depends on the MULTI_PH_8K_4K_2K_EN bit, the WIDE_EN bit and the PH_LOS_COARSE_LIMT[3:0] bits; when the selected input clock is of other frequencies but 2 kHz, 4 kHz and 8 kHz, the coarse phase limit depends on the WIDE_EN bit and the PH_LOS_COARSE_LIMT[3:0] bits. Refer to the description of the MULTI_PH_8K_4K_2K_EN bit (b4, 5AH) for details.																					
4	MULTI_PH_8K_4K_2K_EN	This bit, together with the WIDE_EN bit (b6, 5AH) and the PH_LOS_COARSE_LIMT[3:0] bits (b3~0, 5AH), determines the coarse phase limit when the selected input clock is of 2 kHz, 4 kHz or 8 kHz. IN_2K_4K_8K_INV	8K_EN	2K_EN	2K_8K_PUL_POSITION	8K_INV	8K_PUL	2K_INV	2K_PUL
Bit	Name	Description					
7	IN_2K_4K_8K_INV	This bit determines whether the input clock is inverted before locked by the T0 DPLL when the input clock is 2 kHz, 4 kHz or 8 kHz. 0: Not inverted. (default) 1: Inverted.					
6	8K_EN	This bit determines whether an 8 kHz signal is enabled to be output on FRSYNC_8K. 0: Disabled. FRSYNC_8K outputs low. 1: Enabled. (default)					
5	2K_EN	This bit determines whether a 2 kHz signal is enabled to be output on MFRSYNC_2K. 0: Disabled. MFRSYNC_2K outputs low. 1: Enabled. (default)					
4	2K_8K_PUL_POSITION	This bit is valid only when FRSYNC_8K and/or MFRSYNC_2K output pulse; i.e., when one of the 8K_PUL bit (b2, 74H) and the 2K_PUL bit (b0, 74H) is '1' or when the 8K_PUL bit (b2, 74H) and the 2K_PUL bit (b0, 74H) are both '1'. It determines the pulse position referring to the standard 50:50 duty cycle. 0: Pulsed on the falling edge of the standard 50:50 duty cycle position. (default) 1: Pulsed on the rising edge of the standard 50:50 duty cycle position.					
3	8K_INV	This bit determines whether the output on FRSYNC_8K is inverted. 0: Not inverted. (default) 1: Inverted.					
2	8K_PUL	This bit determines whether the output on FRSYNC_8K is 50:50 duty cycle or pulsed. 0: 50:50 duty cycle. (default) 1: Pulsed. The pulse width is defined by the period of the output on OUT2.					
1	2K_INV	This bit determines whether the output on MFRSYNC_2K is inverted. 0: Not inverted. (default) 1: Inverted.					
0	2K_PUL	This bit determines whether the output on MFRSYNC_2K is 50:50 duty cycle or pulsed. 0: 50:50 duty cycle. (default) 1: Pulsed. The pulse width is defined by the period of the output on OUT2.

## 7 THERMAL MANAGEMENT

The device operates over the industry temperature range -40°C ~ +85°C. To ensure the functionality and reliability of the device, the maximum junction temperature  $T_{jmax}$  should not exceed 125°C. In some applications, the device will consume more power and a thermal solution should be provided to ensure the junction temperature  $T_j$  does not exceed the  $T_{jmax}$ .

### 7.1 JUNCTION TEMPERATURE

Junction temperature  $T_j$  is the temperature of package typically at the geographical center of the chip where the device's electrical circuits are. It can be calculated as follows:

$$\text{Equation 1: } T_j = T_A + P \times \theta_{JA}$$

Where:

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance of the Package

$T_j$  = Junction Temperature

$T_A$  = Ambient Temperature

$P$  = Device Power Consumption

In order to calculate junction temperature, an appropriate  $\theta_{JA}$  must be used. The  $\theta_{JA}$  is shown in Table 32:

Power consumption is the core power excluding the power dissipated in the loads. Table 31 provides power consumption in special environments.

Table 31: Power Consumption and Maximum Junction Temperature

Package	Power Consumption (W)	Operating Voltage (V)	$T_A$ (°C)	Maximum Junction Temperature (°C)
LQFP/PP64	1.57	3.6	85	125
TQFP/EDG64	1.57	3.6	85	125

### 7.2 EXAMPLE OF JUNCTION TEMPERATURE CALCULATION

Assume:

$$T_A = 85^\circ\text{C}$$

$$\theta_{JA} = 21.7^\circ\text{C/W (TQFP/EDG64 Soldered \& when airfow rate is 0 m/s)}$$

$$P = 1.57\text{W}$$

Table 32: Thermal Data

Package	Pin Count	Thermal Pad	$\theta_{JC}$ (°C/W)	$\theta_{JB}$ (°C/W)	$\theta_{JA}$ (°C/W) Air Flow in m/s					
					0	1	2	3	4	5
LQFP/PP64	64	No	12.3	35.1	43.1	40	38.1	37.3	36.5	36.1
TQFP/EDG64	64	Yes/Exposed	12.6	35.3	37.0	32.1	30.4	29.4	28.7	28.1
TQFP/EDG64	64	Yes/Soldered	12.6	1.3	21.7	17.3	16.2	15.6	15.2	14.9

The junction temperature  $T_j$  can be calculated as follows:

$$T_j = T_A + P \times \theta_{JA} = 85^\circ\text{C} + 1.57\text{W} \times 21.7^\circ\text{C/W} = 119.1^\circ\text{C}$$

The junction temperature of 119.1°C is below the maximum junction temperature of 125°C so no extra heat enhancement is required.

In some operation environments, the calculated junction temperature might exceed the maximum junction temperature of 125°C and an external thermal solution such as a heatsink is required.

### 7.3 HEATSINK EVALUATION

A heatsink is expanding the surface area of the device to which it is attached.  $\theta_{JA}$  is now a combination of device case and heat-sink thermal resistance, as the heat flowing from the die junction to ambient goes through the package and the heatsink.  $\theta_{JA}$  can be calculated as follows:

$$\text{Equation 2: } \theta_{JA} = \theta_{JC} + \theta_{CH} + \theta_{HA}$$

Where:

$\theta_{JC}$  = Junction-to-Case Thermal Resistance

$\theta_{CH}$  = Case-to-Heatsink Thermal Resistance

$\theta_{HA}$  = Heatsink-to-Ambient Thermal Resistance

$\theta_{CH} + \theta_{HA}$  determines which heatsink and heatsink attachment can be selected to ensure the junction temperature does not exceed the maximum junction temperature. According to Equation 1 and 2,

$\theta_{CH} + \theta_{HA}$  can be calculated as follows:

$$\text{Equation 3: } \theta_{CH} + \theta_{HA} = (T_j - T_A) / P - \theta_{JC}$$

Assume:

$$T_j = 125^\circ\text{C (} T_{jmax} \text{)}$$

$$T_A = 85^\circ\text{C}$$

$$P = 1.57\text{W}$$

$$\theta_{JC} = 12.6^\circ\text{C/W (TQFP/EDG64)}$$

$\theta_{CH} + \theta_{HA}$  can be calculated as follows:

$$\theta_{CH} + \theta_{HA} = (125^\circ\text{C} - 85^\circ\text{C}) / 1.57\text{W} - 12.6^\circ\text{C/W} = 12.9^\circ\text{C/W}$$

That is, if a heatsink and heatsink attachment whose  $\theta_{CH} + \theta_{HA}$  is below or equal to 12.9°C/W is used in such operation environment, the junction temperature will not exceed the maximum junction temperature.

### 8.5 OUTPUT WANDER GENERATION

Figure 21. Output Wander Generation

### 8.6 INPUT / OUTPUT CLOCK TIMING

The inputs and outputs are aligned ideally. But due to the circuit delays, there is delay between the inputs and outputs.

**NOTES:**

- ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M-1982
- TOP PACKAGE MAY BE SMALLER THAN BOTTOM PACKAGE BY .15 mm
- DATUMS [A-B] AND [-D-] TO BE DETERMINED AT DATUM PLANE [-H-]
- DIMENSIONS D AND E ARE TO BE DETERMINED AT SEATING PLANE [-C-]
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS .25 mm PER SIDE. D1 AND E1 ARE MAXIMUM BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH
- DETAILS OF PIN 1 IDENTIFIER IS OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION IS .08 mm IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.
- EXACT SHAPE OF EACH CORNER IS OPTIONAL
- THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN .10 AND .25 mm FROM THE LEAD TIP
- ALL DIMENSIONS ARE IN MILLIMETERS
- THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO-136, VARIATION BU AND REGISTRATION MS-026, VARIATION BCB.
