

### General Description

The ILC1832 is a multifunction circuit which monitors microprocessor activity, external reset and power supplies in microprocessor based systems. This circuit functions include a watchdog timer, power supply monitor, microprocessor reset, and manual pushbutton reset input.

The power supply line is monitored with a comparator and an internal voltage reference.  $\overline{RST}$  is forced low when an out-of-tolerance condition exists and remains asserted for at least 250ms after  $V_{CC}$  rises above the threshold voltage (2.55V or 2.88V). The  $\overline{RST}$  pin will remain logic low with  $V_{CC}$  as low as 1.4V.

The Watchdog input ( $\overline{ST}$ ) monitors μP activity and will assert  $\overline{RST}$  if no μP activity has occurred within the watchdog time-out period. The watchdog timeout period is selectable with nominal periods of 150, 600, or 1200 milliseconds.

### Features

- Power OK/Reset Time Delay, 250ms min.
- Watchdog Timer, 150 ms, 600ms, or 1.2s Typical
- Precision Supply Voltage Monitor, Select Between 5% or 10% of Supply Voltage
- 18μA Supply Current
- Debounced External Reset Input
- 8-Pin SOIC or DIP Package

### Applications

- Computers
- Controllers
- Critical Microprocessor Power Monitoring
- Intelligent Instruments
- Portable Equipment

### Ordering Information

Part	Package	Temp. Range
ILC1832N	8-Lead PDIP	-40°C to +85°C
ILC1832M	8-Lead SOIC	-40°C to +85°C

### Typical Circuit

### Pin-Package Configurations

### Absolute Maximum Ratings

Parameter	Symbol	Ratings	Units
Terminal Voltage	$V_{CC}$	-0.3 to 7.0	V
	All other inputs	-0.3 to ( $V_{CC} + 0.3$ )	V
Input Current	$V_{CC}$	250	mA
	GND All other inputs	25	mA
Operating Temperature Range	$T_A$	-40 to +85	°C
Storage Temperature Range		-65 to +150	°C
Lead Temperature (Soldering, 10 sec.)		300	°C
Power Dissipation		700	mW

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability. Operating ranges define those limits between which the functionality of the device is guaranteed.

### Electrical Characteristics

$V_{CC} = 3$  to  $5.5V$ ,  $T_A =$  Operating Temperature Range, unless otherwise noted.

Parameter	Conditions	Min	Typ	Max	Units
Supply Voltage Range, $V_{CC}$				5.5	V
Supply Current, $I_{CC}$	$V_{CC} = 5V$ (See Note 1) $V_{CC} = 3.3V$ (See Note 1)		18 15	30 25	µA
$\overline{ST}$ and $\overline{PBRST}$ Input Levels	$V_{IH}, V_{CC} \geq 2.7V$ $V_{IH}, V_{CC} < 2.7V$ $V_{IL}$	2.0 $V_{CC} - 0.4$ -0.3		$V_{CC} + 0.3$ $V_{CC} + 0.3$ 0.5	V
Input Leakage $\overline{PBRST}$ , $I_{IL}$	(See Note 2)			±1	µA
Output Voltage, $\overline{RST}$ , RST	$I_{SOURCE} = 350\mu A, V_{CC} = 3.3V$	2.4			V
Output Voltage, $\overline{RST}$ , RST	$I_{SINK} = 10mA, V_{CC} = 3.3V$			0.4	V
Output Voltage, $\overline{RST}$	$I_{SINK} = 50\mu A, V_{CC} = 1.4V$			0.3	V
$V_{CC}$ 5% Trip Point (Reset Threshold Voltage)	TOL= GND	2.80	2.88	2.97	V
$V_{CC}$ 10% Trip Point (Reset Threshold Voltage)	TOL= $V_{CC}$	2.47	2.55	2.64	V
Input Capacitance, $\overline{ST}$ , TOL	$C_{IN}$ (See Note 3)			5	pF
Output Capacitance, $\overline{RST}$ , RST	$C_{OUT}$ (See Note 3)			7	pF
$\overline{PBRST}$ Min. Pulse Width, $t_{PB}$	$\overline{PBRST} = V_{IL}$ (See note 4)	20			ms
$\overline{PBRST}$ Delay, $t_{PBD}$		1	4	20	ms
Reset Active Time, $t_{RST}$		250	610	1000	ms
$\overline{ST}$ Pulse Width, $t_{ST}$		20			ns
$\overline{ST}$ Timeout Period, $t_{TD}$	TD = 0V TD = Open TD = $V_{CC}$	62.5 250 500	150 600 120 0	250 1000 2000	ms
$V_{CC}$ Fall Time, $t_F$		40			µs
$V_{CC}$ Rise Time, $t_R$		0			ns
$V_{CC}$ Detect to RST Low and RST High, $t_{RPD}$	$V_{CC}$ Falling at 1.66 mV/µs		5	8	µs
$V_{CC}$ Detect to RST Open and RST Low, $t_{RPU}$	$V_{CC}$ Rising	250	610	1000	ms

Note 1:  $I_{CC}$  is measured with  $\overline{PBRST}$  and all outputs open and inputs within 0.5V of supply rails.

Note 2:  $\overline{PBRST}$  has an internal 40kΩ (typical) pull-up resistor to  $V_{CC}$ .

Note 3: Guaranteed by design at  $T_A = 25^\circ C$ .

Note 4:  $\overline{PBRST}$  must be held low for a minimum of 20ms to guarantee a reset.

Pin Functions

Pin Number	Pin Name	Description
1	$\overline{\text{PBRST}}$	Pushbutton reset input. This input is debounced and can be driven with external logic signals or a mechanical pushbutton to actively force a reset. All pulses less than 1ms in duration on the $\overline{\text{PBRST}}$ pin are ignored. Any pulse with a duration of 20ms or greater is guaranteed to cause a reset. $\overline{\text{PBRST}}$ has an internal 40kΩ (typical) pull-up resistor to $V_{CC}$ .
2	TD	Time delay input. This input selects the timebase used by the watchdog timer. When TD = 0V, the watchdog timeout period is set to a nominal value of 150ms, when TD = open, the watchdog timeout period is set to a nominal value of 600ms and when TD = $V_{CC}$ , the watchdog timeout period is 1.2 sec nominally.
3	TOL	Tolerance select input. Selects whether 5% or 10% of $V_{CC}$ is used as the reset threshold voltage. When TOL = 0V, the 5% tolerance level is selected and when TOL = $V_{CC}$ , a 10% tolerance level is selected.
4	GND	Ground pin, 0V reference.
5	RST	RST is asserted high if either $V_{CC}$ goes below the reset threshold, the watchdog times out or $\overline{\text{PBRST}}$ is pulled low for a minimum of 20ms. RST remains asserted for one reset timeout period after $V_{CC}$ exceeds the reset threshold or after the watchdog times out or after $\overline{\text{PBRST}}$ goes high.
6	$\overline{\text{RST}}$	$\overline{\text{RST}}$ is asserted low if either $V_{CC}$ goes below the reset threshold, the watchdog times out or $\overline{\text{PBRST}}$ is pulled low for a minimum of 20ms. $\overline{\text{RST}}$ remains asserted for one reset timeout period after $V_{CC}$ exceeds the reset threshold or after the watchdog times out or after $\overline{\text{PBRST}}$ goes high. Open-drain output.
7	ST	Input to the watchdog timer. If ST does not see a transition from high to low within the watchdog timeout period, RST and $\overline{\text{RST}}$ will be asserted.
8	$V_{CC}$	Power supply input.

Block Diagram

**Circuit Description**

**Power Monitor**

The RST and  $\overline{\text{RST}}$  pins are asserted whenever  $V_{\text{CC}}$  falls below the reset threshold voltage set by the TOL pin. A 5% tolerance level (2.88V reset threshold voltage) can be selected by connecting the TOL pin to ground or a 10% tolerance (2.55V reset threshold voltage) can be selected by connecting the TOL pin to  $V_{\text{CC}}$ . The reset pins will remain asserted for a period of 250ms after  $V_{\text{CC}}$  has risen above the reset threshold voltage. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure.  $\overline{\text{RST}}$  will remain valid with  $V_{\text{CC}}$  as low as 1.4V.

Power-Up/Power-Down Sequence

**Watchdog Timer**

The microprocessor can be monitored by connecting the  $\overline{\text{ST}}$  pin (watchdog input) to a bus line or I/O line. If a high-to-low transition does not occur on the  $\overline{\text{ST}}$  pin within the watchdog timeout period set by the TD pin (see Table 1), the RST and  $\overline{\text{RST}}$  pins will be asserted resulting in a microprocessor reset. RST and  $\overline{\text{RST}}$  will remain asserted for 250ms when this occurs. A minimum pulse of 75ns or any transition high-to-low on the  $\overline{\text{ST}}$  pin will reset the watchdog timer. The watchdog timer will be reset if  $\overline{\text{ST}}$  sees a valid transition within the watchdog timeout period.

Watchdog Input

**Pushbutton Reset Input**

The  $\overline{\text{PBRST}}$  input can be driven with a manual pushbutton switch or with external logic signals. The input is internally debounced and requires an active low signal to force the reset outputs into their active states. The  $\overline{\text{PBRST}}$  input will recognize any pulse that is 20ms in duration or greater and will ignore all pulses that are less than 1ms in duration.

Pushbutton Reset

TD Pin	$t_{\text{TD}}$		
	Min.	Typ.	Max.
GND	62.5 ms	150 ms	250 ms
Open	250 ms	600 ms	1000 ms
$V_{\text{CC}}$	500 ms	1200 ms	2000 ms

N Package, 8-Pin Plastic Dual In-Line

Devices sold by Impala Linear Corporation are covered by the warranty and patent indemnification provisions appearing in its Terms of Sale only. Impala Linear Corporation makes no warranty, express, statutory, implied, or by description regarding the information set forth herein or regarding the freedom of the described devices from patent infringement. Impala Linear Corporation makes no warranty of merchantability or fitness for any purpose. Impala Linear Corporation reserves the right to discontinue production and change specifications and prices at any time and without notice.

This product is intended for use in normal commercial applications. Applications requiring an extended temperature range, unusual environmental requirements, or high reliability applications, such as military and aerospace, are specifically not recommended without additional processing by Impala Linear Corporation.

Impala Linear Corporation assumes no responsibility for the use of any circuitry other than circuitry embodied in an Impala Linear Corporation product. No other circuits, patents, licenses are implied.

Life Support Policy

Impala Linear Corporation's products are not authorized for use as critical components in life support devices or systems.

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labelling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
