## Octal 3-State Noninverting <br> Bus Transceiver

These octal bus transceiver are designed for asynchronous two-way communication between data buses. The control function implementation minimized external timing requirements.

The device allows data transmission from the A bus to the B bus or from the B bus to the A bus depending upon the logic level at the directional control (DIR) input. The enable input(E) can be used to disable the device so that the buses are effectively isolated.

- Bidirectional Bus Transceiver in a High-Density 20-Pin Package
- 3-state Outputs Dirve Bus Lines Directly
- P-N-P Inputs D-C Loading on Bus Lines
- Hysteresis at Bus Inputs Improve Noise Margins
- Typical Propagation Delay Times; Port to Port ... 8 ns
