FEATURES

- Guaranteed $\pm 1\%$ reference voltage tolerance
- Accurate oscillator discharge current
- Guaranteed $\pm 10\%$ frequency tolerance
- Low start-up current ($< 500 \mu A$)
- Under voltage lockout with hysteresis
- Output state completely defined for all supply and input conditions
- Interchangeable with IP and UC1842/3 series for improved operation
- 500kHz Oscillator operation

DESCRIPTION

The IP1842A/IP1843A series of switching regulator control circuits contain all the functions necessary to implement off-line, current mode switching regulators, using a minimum number of external parts. Functions included are voltage reference, error amplifier, current sense comparator, oscillator, totem-pole output driver and under-voltage lockout circuitry.

Although pin compatible with the standard IP1842/3 parts these devices offer improved performance in several areas. They also offer tighter specification and improved performance over the IP and UC1842/3 series, whilst retaining complete compatibility.

APPLICATIONS INFORMATION

Oscillator Waveforms and Maximum Duty Cycle

Oscillator timing capacitor C_T is charged by V_{REF} through R_T and discharged by an internal current source. During the discharge time, the internal clock signal blanks the output to the low state. Selection of R_T and C_T therefore determines both oscillator frequency and maximum duty cycle. Charge and discharge times are determined by the formulae:

$$t_c \approx 0.55 R_T C_T$$

$$t_d \approx R_T C_T \ln \left(\frac{.0063 R_T - 2.3}{.0063 - 4} \right)$$

$$\text{Resultant frequency } f = \frac{1}{(t_c + t_d)}$$

For $R_T > 5k\Omega$,

$$\text{Resultant frequency } f \approx \frac{1.8}{(R_T C_T)}$$

Open-Loop Laboratory Test Fixture

High peak current associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to pin 5 in a single point ground. The transistor and 5K potentiometer are used to sample the oscillator waveform and apply an adjustable ramp to pin 3.
