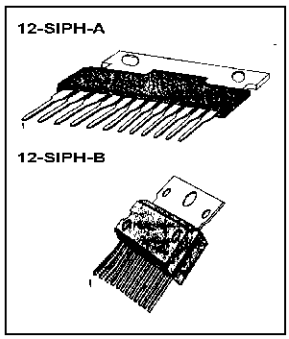
INTRODUCTION

The KA9257, a monolithic integrated circuit, is a dual power operational amplifier with a maximum output current of 0.5A. Since it consists of a balance transless, both forward and reverse operation of the motor can be achieved on a single power source. The device is suitable for a CD player.



FEATURES

- 2 channel BTL driver
- Low input bias (Iib =30nA)
- Built in phase compensation capacitor
- Housed in a 12SIP H/S package for easy heat discharge
- Improved crosstalk: (CT = 80dB)
- HIgh output current: (I_O = 0.5A)

Precautions

1. In desgning the board, a minimum of 6cms of segregation should be allowed between the motor drive IC (KA9257) and other components such as the micom and/or Recorder/Player Ics.
2. To get a stable supply of voltage and radiation shield effect, the CD Deck needs to be grounded.
