

KAI-1003

1024 (H) x 1024 (V) Interline CCD Image Sensor

Description

The KAI-1003 Image Sensor is a high-performance megapixel monochrome image sensor designed for a wide range of medical imaging and machine vision applications.

The 12.8 μm square pixels with microlenses provide high sensitivity and the large capacity results in large dynamic range. The two output, split horizontal register and several binning modes allow a 15 to 60 frame per second (fps) video rate for the progressively scanned images.

The vertical overflow drain structure provides anti-blooming protection, and enables electronic shuttering for precise exposure control. Other features include low dark current, negligible lag and low smear.

Table 1. GENERAL SPECIFICATIONS

Parameter	Typical Value
Architecture	Interline CDD; Progressive Scan
Total Number of Pixels	1056 (H) \times 1032 (V)
Number of Effective Pixels	1028 (H) \times 1028 (V)
Number of Active Pixels	1024 (H) \times 1024 (V)
Pixel Size	12.8 μm (H) \times 12.8 μm (V)
Active Image Size	13.1 mm (H) \times 13.1 mm (V), 18.5 mm (Diagonal), 4/3" Optical Format
Aspect Ratio	1:1
Number of Outputs	1 or 2
Charge Capacity	170,000 e ⁻
Output Sensitivity	7.5 $\mu\text{V}/\text{e}^-$
Quantum Efficiency (500 nm)	45%
Read Noise (f = 20 MHz)	40 e ⁻ rms
Dark Current	< 0.5 nA/cm ²
Dynamic Range	72 dB
Blooming Suppression	> 100 X
Smear	-80 dB
Maximum Pixel Clock Speed	20 MHz
Maximum Frame Rate Single Output Dual Output Dual Output 2 \times 2 Bin	15 fps 30 fps 60 fps
Package	28-Pin CERDIP
Cover Glass	AR Coated, 2 Sides

NOTE: All Parameters are specified at T = 40°C unless otherwise noted.

Figure 1. KAI-1003 Interline CCD Image Sensor

Features

- Megapixel Progressive Scan Interline CCD
- 1024 (H) \times 1024 (V) Imaging Pixels
- 12.8 μm Square Pixels
- 13.1 mm Square Imaging Area
- Microlenses for Increased Sensitivity
- Large Capacity (170 ke⁻)
- Split Horizontal Register for 1 or 2 Outputs
- Binning to 1 \times 2 or 2 \times 2

Applications

- Machine Vision
- Medical
- Scientific

DEVICE DESCRIPTION

Architecture

Figure 2. Sensor Architecture

The KAI-1003 is a high-performance, interline charge-coupled device (CCD) designed for a wide range of medical imaging and machine vision applications. The device is built using an advanced two-phase, double-polysilicon, NMOS CCD technology. The p+n-pn-photodiodes eliminate image lag while providing anti-blooming protection and electronic shutter capability. The 12.8 μm square pixels with microlenses provide high sensitivity and large dynamic range. The two output, split horizontal register and several binning modes enable a 15 to 60 frame per second (fps) video rate with this megapixel progressive scan imager.

Image Acquisition

An electronic representation of an image is formed when incident photons falling on the sensor plane create electron-hole pairs within the individual silicon photodiodes. These photoelectrons are collected locally by the formation of potential wells at each photodiode. Below photodiode saturation, the number of photoelectrons collected at each pixel is linearly dependent on light level

and integration time and non-linearly dependent on wavelength. When the photodiode's charge capacity is reached, excess electrons are discharged into the substrate to prevent blooming. The integration time can be decreased below the frame time by using an electronic shutter, which is a voltage pulse applied to the substrate to empty the photodiodes.

Charge Transport

The integrated charge from each photodiode is transported to the output by a three-step process. The charge is first transferred from the photodiodes to the vertical shift registers by applying a large positive voltage to one of the vertical CCD phases. This transfer occurs simultaneously for all photodiodes. The charge is then transported from the vertical CCD registers to the horizontal CCD line by line in parallel. Finally, the horizontal CCD register transports each line of charge pixel by pixel serially to one or both of the output structures.

The single horizontal CCD register is split into two halves to allow a variety of line readout modes, as shown in

KAI-1003

Figure 2 and Figure 3. The A output half of the register is a true two-phase design, which results in unidirectional transport using phases H1A and H2A. The B output half of the register is a pseudo two-phase design, which allows bi-directional transport using phases H1B, H2B, H1C and H2C. Dual output is achieved with all of the first phases identical and all the second phases identical. If the clocks of H1A and H2A phases are shifted by one half cycle, the output remains dual with the outputs alternating, so that only one analog-to-digital converter is necessary. Finally, single output of the entire image from the A output is obtained by

complementing the C phases, which reverses transport in the B half of the horizontal CCD.

Binning can be used in a 1×2 and a 2×2 mode. Two successive vertical transfers vertically bin the charge directly onto the horizontal CCD, as shown in Figure 13 and Figure 14. Horizontal binning is accomplished by two successive horizontal transfers onto the H22 gate, which then transfers the charge to the output structure, as shown in Figure 15.

Combinations of output modes, binning and horizontal clock frequency allow the range of frame rates listed in.

Table 4. KAI-1003 CALCULATED CLOCK PARAMETERS

Parameter	Binning (H × V)	1×1	1×2	2×1	2×2	1×1	Unit
	Output	Dual	Dual	Dual	Dual	Single	
HORIZONTAL CLOCK							
Frequency		20	20	20	40	20	MHz
Period	Actual	50	50	50	25	50	ns
	Effective	50	50	100	50	50	
Pixel Counts	Actual	532	532	532	532	1060	
	Effective	532	532	266	266	1060	
VERTICAL TO HORIZONTAL TRANSFER (HORIZONTAL RETRACE TIME)							
Equivalent H-Clock Counts (m)		80	80	80	160	80	
Duration		4.0	4.0	4.0	4.0	4.0	μs
HORIZONTAL LINE TIME							
Total H-Clock Counts		612	612	612	692	1140	
Line time		30.6	30.6	30.6	17.3	57.0	μs
VERTICAL CLOCK							
Line Counts	Actual Effective	1032 1032	1032 516	1032 516	1032 516	1032 1032	
PHOTODIODE READ (VERTICAL RETRACE TIME)							
Equivalent Line Counts (n)		4	4	4	7	2	
Duration		122.4	122.4	122.4	121.1	114.0	μs
FRAME RATE							
Total Effective Line Counts		1036	520	520	523	1034	
Frame Time		31.7	15.9	15.9	9.0	58.9	ms
Frame Rate		31.5	62.8	62.8	110.5	17.0	frames/s

1. Time values have been rounded.
2. The number of counts (n and m) shown here are nominal integers, but in general they do not need be integers. They can be adjusted for frame time, so long as the horizontal and vertical retrace times exceed the minimums specified in AC Timing Requirements.
3. Operation at 40 MHz will have increased readout noise.

Output Structure

Charge presented to the floating diffusion (FD) is converted into a voltage and current amplified in order to drive off-chip loads. The resulting voltage change seen at the output is linearly related to the amount of charge placed on the FD. Once the signal has been sampled by the system electronics, the reset gate (ϕ_R) is clocked to remove the signal and the FD is reset to the potential applied by the reset drain (RD). More signal at the floating diffusion reduces the voltage seen at the output pin. In order to activate the output structure, an off-chip load must be added to the output pin of the device.

Non-Imaging Pixels

In addition to the 1024 (H) by 1024 (V) imaging pixels, there are active buffer, light shielded and empty pixels, as

shown in Figure 2. A two-pixel border of active buffer pixels surrounds the imaging area. These buffer pixels respond to illumination but are not tested for defects and non-uniformities. Two light shielded rows lead and follow each frame, and 14 light shielded columns lead and follow each line. The light shielded columns are tested for column defects and can be used for dark reference. Only the center 10 columns by 1028 rows of light shielded region on each side can be used for dark reference due to light leakage into the border of two pixels at the edges. Finally, two empty pixels occur at the beginning of each line, which are empty shift register cycles not associated with any vertical CCD columns. Empty pixels may also occur at the end of the line, depending on the timing.

Gain Difference between the Two Video Outputs (Note 5)		-	-	10	%
Non-Uniformity of Gain between the Two Outputs (Note 5)		-	0.5	1.5	%

1. The illumination required to bloom the image sensor reported as a multiple of the saturation intensity. Blooming is defined as doubling the vertical height of a spot that is 10% of the vertical CCD height at the saturation intensity.
2. Measured with continuous green light centered at 550 nm, F/4 optics and a spot size that is 10% of the vertical CCD height.
3. Measured at 90% of 150 ke^- output.
4. Measured in the center 50×50 pixels.
5. Between 10% and 90% of 150 ke^- output.
6. Measured without electronic shutter operation.

Typical Quantum Efficiency

Figure 5. Quantum Efficiency Spectrum

Angular Dependence of Quantum Efficiency

For the curve marked “Horizontal”, the incident light angle is varied in a plane parallel to the HCCD.

Figure 6. Angular Dependence of Quantum Efficiency

DEFECT SPECIFICATIONS

Defect Test Conditions

Temperature: 40°C
Integration Time: 33 ms (20 MHz HCCD Frequency, No Binning, 30 fps Frame Rate)
Light Source: Continuous Green Light Centered at 550 nm
Operation: Nominal Voltages and Timing

Table 7. DEFECT DEFINITIONS

Name	Maximum Number	Definition
Major Defective Pixel	20	A pixel whose signal deviates by more than 25 mV from the mean value of all active pixels under dark field condition or by more than 8% from the mean value of all active pixels under uniform illumination at 105 ke ⁻ output signal.
Minor Defective Pixel	100	A pixel whose signal deviates by more than 8 mV from the mean value of all active pixels under dark field condition.
Cluster Defect	4	A group of 2 to 6 contiguous major defective pixels, but no more than 2 adjacent defects horizontally.
Column Defect	0	A group of more than 6 contiguous major defective pixels along a single column.

Defect Proximity

Minimum Distance between Defective Clusters: 2 Pixels in All Directions without Major Pixel Defects
Minimum Distance between Defective Columns: 3 Columns without Column Defects or Cluster Defects

OPERATION

Table 8. ABSOLUTE MAXIMUM RATINGS

Item	Description	Min.	Max	Unit
Temperature	Operation to Specification	0	40	°C
	Operation without Damage	-10	70	°C
	Storage	-55	80	°C
Relative Humidity	Operation without Damage (Note 1)	0	95	%
Voltage (Between Pins)	SUB – GND (Notes 2, 5)	-0.6	50	V
	V _{RD} , V _{SS} , V _{DD} – GND	-0.6	25	V
	V _{MIN} – GND	-15	0.6	V
	All Clocks – GND	-	17	V
	φV1 – φV2 (Note 3)	-	17	V
	φH1 – φH2	-	17	V
	φH1, φH2 – φV2	-	17	V
	φH2 – OG	-	17	V
	V _{LG} , OG – GND	-	17	V
	φR, φH1, φH2 – V _{MIN}	-	17	V
Capacitance	Output Load Capacitance (C _{LOAD}) (Note 4)	-	10	pF
Current	Output Bias Current (I _{DD}) (Note 4)	-	10	mA

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

- Without condensation.
- Under normal operating conditions, the substrate voltage should be maintained above 8.0 V. The substrate voltage should not remain above 25 V for longer than 100 μs.
- Maximum of 20 V for φV1H – φV2L, with 20 μs maximum duration.
- Each output.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

Table 9. DC OPERATING CONDITIONS

Description	Symbol	Min.	Nom.	Max.	Unit
Output Gate	OG	1.8	2.0	2.2	V
Reset Drain	V _{RD}	10.0	10.5	11.0	V
Output Amplifier Return (Note 1)	V _{SS}	-	0.0	-	V
Output Amplifier Load Gate	V _{LG}	1.4	1.5	1.6	V
Output Amplifier Supply	V _{DD}	14.5	15.0	15.5	V
Disable ESD Protection (Note 2)	V _{MIN}	-	-8.5	-	V
Substrate (Notes 3, 4, 5)	V _{SUB}	8.0	TBS	18.0	V
Ground, P-Well (Note 4)	GND	-	0.0	-	V

- Current sink.
- Connect a 0.001 μF capacitor between V_{MIN} and GND. V_{MIN} must be more negative than the low voltage of any of the φH clocks and should be established before the φH voltage is applied.
- DC value when electronic shutter is not in use. See AC Clock Level Conditions for electronic shutter pulse voltage. The operating value of the substrate voltage, V_{SUB}, will be supplied with each shipment.
- Ground and substrate biases should be established before other gate and diode potentials are applied.
- Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

Table 10. AC CLOCK LEVEL CONDITIONS

Description	Level	Symbol	Min.	Nom.	Max.	Unit
Vertical CCD Clocks (Note 1)	High	$\phi V2H$	9.5	10.5	11.5	V
	Mid	$\phi V1M, \phi V2M$	-0.8	-0.5	0.0	V
	Low	$\phi V1L, \phi V2L$	-9.0	-8.5	-8.0	V
Horizontal CCD Clocks (Note 1)	High	$\phi H1H, \phi H2H$	4.5	5.0	5.5	V
	Low	$\phi H1L, \phi H2L$	-6.5	-6.0	-5.5	V
Reset Clock	Amplitude	ϕR_{SWING}	-	5.0	-	V
	Low (Note 2)	$V_{\phi Rlow}$	0	TBS	5.0	V
Electronic Shutter Pulse (Notes 3, 4)	Shutter	$V_{SHUTTER}$	37	40	45	V

1. For best results, the CCD clock swings must be greater than or equal to the nominal values.
2. Reset clock low level voltage will be supplied with each shipment.
3. Electronic shutter pulse voltage referenced to GND. See DC Operating Conditions for DC level when electronic shutter is not in use.
4. Refer to Application Note *Using Interline CCD Image Sensors in High Intensity Visible Lighting Conditions*.

Electronic Shutter Operation

Electronic shuttering is accomplished by pulsing the substrate voltage to empty the photodiodes. See Figure 16

for timing. The pulse must not occur while useful information is being read from a line.

Table 11. CALCULATED CLOCK CAPACITANCE

Description	Phase	Symbol	Typical	Unit
Vertical CCD Clocks (Note 1)	1 to GND	$C_{\phi V1}$	55/37	nF
	2 to GND	$C_{\phi V2}$	50/32	nF
	1 to 2	$C_{\phi V1 - \phi V2}$	4	nF

Sample Delay (Note 5)	t_{SD}	–	–	–	ns
Electronic Shutter Pulse Duration	t_{ES}	5	7.5	10	μs
Electronic Shutter Horizontal Delay	t_{ESHD}	1.0	–	–	μs

1. Non-binning/binning times.
2. The rising edge of ϕ_R should be coincident with the rising edge of ϕ_{H22} , within ± 5 ns.
3. Horizontal CCD clock frequency can be increased to 40 MHz, with increased readout noise.
4. See Table 4 for nominal line and frame time in each mode.
5. The clamp delay and sample delay should be adjusted for optimum results.

Table 13. CCD CLOCK WAVEFORM CONDITIONS

Description	Phase	Symbol	t_{WH}	t_{WL}	t_R	t_F	Unit
NON-BINNING							
Vertical CCD Clocks	1	$\phi_{V1M/L}$	–	1.5	0.5	0.5	μs
	2	$\phi_{V2M/L}$	1.5	–	0.5	0.5	μs
	2, High	ϕ_{V2H}	15	–	1.0	1.0	μs
Horizontal CCD Clocks	1	ϕ_{H1}	20.5	21.5	4.0	4.0	ns
	2	ϕ_{H2}	20.5	21.5	4.0	4.0	ns
