

400mA Buck/Boost Charge Pump LED Driver

FEATURES

- Output Current up to 400mA
- Up to 94% Efficiency in Torch Mode
- Automatic Softstart Limits Inrush Current
- Adjustable FLASH Mode
- x1 and x2 Automatic Modes for High Efficiency
- Minimum External Components: No Inductors
- High Frequency Operation: 2.4 MHz
- Low 50mV Reference for low Loss Sensing
- 1μA Shutdown Current
- PWM Dimming Control
- Automatic Switchover Between Buck/Boost
- Overvoltage Protection on Output
- Overcurrent/Temperature Protection
- Low Ripple and EMI
- Space Saving 10-pin 3mm x 3mm DFN Package

DESCRIPTION

The KB3386 is a current regulated charge pump ideal for powering high brightness LEDs for camera flash applications. The charge pump can be set to regulate two current levels for FLASH and TORCH modes. The KB3386 automatically switches modes between step-up and step-down ensuring that LED current does not depend on the forward voltage. A low current sense reference voltage (50mV) allows the use of small 0603 current sensing resistors. The KB3386 is offered in 10-pin DFN package.

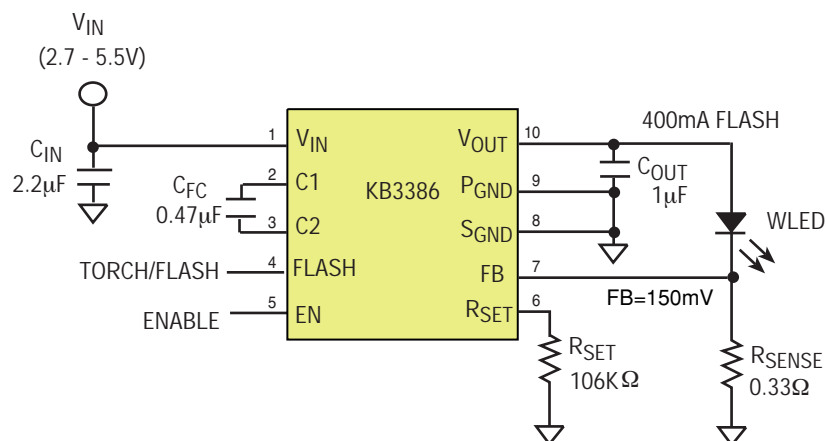

APPLICATIONS

- White LED Torch/Flash for Cell Phones, DSCs, and Camcorders
- Generic Lighting/Flash/Strobe Applications
- White LED Backlighting

Now Available in Lead Free Packaging

ORDER INFORMATION

Part number	Package	Marking
KB3386ER	DFN-10, GREEN	86ER

PIN DESCRIPTION

PIN NUMBER	PIN NAME	DESCRIPTION
1	V _{IN}	Input Voltage for the charge pump. Decouple with 2.2μF ceramic capacitor close to the pins of the IC.
2	C1	Positive input for the external fly capacitor. Connect a ceramic 0.47μF capacitor close to the pins of the IC.
3	C2	Negative input for the external fly capacitor. Connect a ceramic 0.47μF capacitor close to the pins of the IC.
4	FLASH	Logic input to toggle operation between FLASH and TORCH mode. In TORCH mode FB is regulated to the internal 50mV reference. In FLASH mode FB reference voltage can be adjusted by changing the resistor from R _{SET} pin to ground. Choose the external current sense resistor (R _{SENSE}) based on desired current in TORCH mode.
5	EN	Shutdown control input. Connect to V _{IN} for normal operation, connect to ground for shutdown.
6	R _{SET}	Connect a resistor from this pin to ground. When in FLASH mode (FLASH = High) this resistor sets the current regulation point according to the following: $V_{FB} = (1.26V / R_{SET}) * 11.2K\Omega$.
7	FB	Feedback input for the current control loop. Connect directly to the current sense resistor.
8	S _{GND}	Internal ground pin. Control circuitry returns current to this pin.
9	P _{GND}	Power ground pin. Fly capacitor current returns through this pin.
10	V _{OUT}	Charge Pump Output Voltage. Decouple with an external capacitor. At least 1uF is recommended. Higher capacitor values reduce output ripple.

400mA Buck/Boost Charge Pump LED Driver

ABSOLUTE MAXIMUM RATINGS (Ta=+25°C)

V_{IN}, V_{OUT} -0.3V to 6V
 Output Current Pulse (Flash) 500mA
 Output Current Continuous (Torch) 200mA
 Storage Temperature -65°C to +150°C
 Operating Temperature -40°C to +85°C
 V_{EN} ZeroV to 7V
 3x3 10 DFN $\Theta_{JA} = 57.1^{\circ}\text{C/W}$
 ESD Rating 2kV HBM

ELECTRICAL CHARACTERISTICS (Ta=+25°C)

$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$, $V_{IN} = 3.6$, $C_{IN} = 2.2\mu\text{F}$, $C_{FC} = 0.47\mu\text{F}$, $C_{OUT} = 1.0\mu\text{F}$. $V_{SHDN} = V_{IN}$, typical values at 25°C . The \blacklozenge denotes the specifications which apply over the full operating range unless otherwise noted.

400mA Buck/Boost Charge Pump LED Driver

FUNCTIONAL DIAGRAM

THEORY OF OPERATION

The KB3386 is a charge pump regulator designed for converting a Li-Ion battery voltage of 2.7V to 4.2V to drive a white LED used in digital still camera Flash and Torch applications. The KB3386 has two modes of operation which are pin selectable for either Flash or Torch. Flash mode is usually used with a pulse of about 200 to 300 milliseconds to generate a high intensity Flash. Torch can be used continuously at a lower output current than Flash and is often used for several seconds in a digital still camera "movie" mode.

The KB3386 also has two modes of operation to control the output current, the 1X mode and 2X mode. Operation begins after the enable pin EN receives a logic high, the bandgap reference wakes up after 200µsec, and then KB3386 goes through a soft-start mode designed to reduce inrush current. The KB3386 starts in the 1X mode, which acts like a linear regulator to control the output current by continuously monitoring the feedback pin FB. In 1X mode, if the KB3386 auto detects a dropout condition, which is when the FB pin is below the

400mA Buck/Boost Charge Pump LED Driver

APPLICATION INFORMATION

regulation point for more than 32 cycles of the internal clock, the KB3386 automatically switches to the 2X mode. The KB3386 remains in the 2X mode until one of four things happens: 1) the enable pin EN has been toggled, 2) the Flash pin has changed from high to low, 3) V_{IN} is cycled or 4) a thermal fault occurs. The 2X mode is the charge pump mode where the output can be pumped as high as two times the input voltage, provided the output does not exceed the maximum voltage for the KB3386, which is internally limited to about 5.5V. In the 2X mode, as in the 1X mode, the output current is regulated by the voltage at the FB pin.

In the Torch mode, (Flash = GND) the Flash pin is set to logic low and the KB3386 FB pin regulates to 50mV output:

$$V_{FB} = 50mV \text{ (Torch Mode)}$$

When in Flash mode, (Flash = V_{IN}), the FB regulation voltage is set by the resistor R_{SET} connected between the R_{SET} pin and S_{GND} and the equation:

$$V_{FB} = (1.26V / R_{SET}) * 11.2K\Omega \text{ (Flash Mode)}$$

Where 1.26V is the internal bandgap reference voltage and 11.2K Ω is an internal resistance used to scale the R_{SET} current. Typical values of R_{SET} are 40K Ω to 180K Ω for a range of $V_{FB} = 300mV$ to 75mV in Flash mode.

The output current is then set in either Flash or Torch mode by the equation:

$$I_{OUT} = V_{FB} / R_{SENSE}$$

Table 1: Recommended Capacitors

OVERTEMPERATURE PROTECTION

When the temperature of the KB3386 rises above 145 degrees Celsius, the over temperature protection circuitry turns off the output switches to prevent damage to the device. If the temperature drops back down below 135 degrees Celsius, the part automatically recovers and executes a soft start cycle.

OVERVOLTAGE PROTECTION

The KB3386 has over voltage protection. If the output voltage rises above the 5.5V threshold, the over voltage protection shuts off all of the output switches to prevent the output voltage from rising further. When the output decreases below 5.5V, the device resumes normal operation

OVERCURRENT PROTECTION

The over current protection circuitry monitors the average current out of the $V_{OUT} = 50mV$ (Torch Mode) pin. If the average output current exceeds approximately 1Amp, then the over current protection circuitry shuts off the output switches to protect the chip.

400mA Buck/Boost Charge Pump LED Driver

APPLICATION INFORMATION

The KB3386 charge pump circuit requires 3 capacitors: 4.7μF input, 1μF output and 0.47μF fly capacitor are typically recommended. For the input capacitor, a larger value of 10μF will help reduce input voltage ripple for applications sensitive to ripple on the battery voltage. All the capacitors should be ceramic to obtain low ESR, which improves bypassing on the input and output and improves output voltage drive by reducing output resistance. X5R or X7R Ceramic capacitors are recommended for most applications. A selection of recommended capacitors is included in Table 1. The input and output capacitors should be located as close to the V_{IN} and V_{OUT} pins as possible to obtain best bypassing, and the returns should be connected directly to the P_{GND} pin or to the thermal pad ground located under the KB3386. The fly capacitor should be located as close to the C1 and C2 pins as possible.

The sense resistor R_{SENSE} is determined by the value needed in the Torch mode for the desired output current by the equation:
 $R_{SENSE} = V_{FB} / I_{OUT}$ where V_{FB} = 50mV (Torch Mode)

Once the R_{SENSE} resistor has been selected for Torch mode, the V_{FB} voltage can be selected for Flash mode using the following equation:

$$V_{FB} = I_{OUT} * R_{SENSE} \text{ (Flash Mode) where } I_{OUT} \text{ is for Flash Mode}$$

Next, the R_{SET} resistor can be selected for Flash mode using the following equation:

$$R_{SET} = (1.26V / V_{FB}) * 11.2K\Omega \text{ (Flash Mode)}$$

For an example of 150mA Torch mode and 400mA Flash mode, the values R_{SENSE} = 0.33Ω, V_{FB} = 135mV (Flash Mode), and R_{SET} = 106KΩ are calculated. The power obtained in the Flash mode would be:

$$P_{FLASH} = V_{FB} * I_{OUT} = 133mV * 400mA = 53mW.$$

The typical 0603 surface mount resistor is rated at 1/10 Watt continuous power and 1/5 Watt pulsed power, more than enough for this application. For other applications, the P_{FLASH} can be calculated from the resistor size selected. The R_{SENSE} resistor is recommended to be size 0603 for most applications.
