KM4211

Dual, 0.2mA, Low Cost, +2.7V & +5V, 35MHz Rail-to-Rail Amp

Features

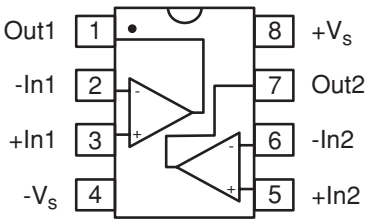
- 208μA supply current
- 35MHz bandwidth
- Fully specified at +2.7V and +5V supplies
- Output voltage range: 0.08V to 4.88V; V_S = +5
- Input voltage range: -0.3V to +3.8V; V_S = +5
- 27V/μs slew rate
- ±8.5mA linear output current
- ±13mA short circuit output current
- 21nV/√Hz input voltage noise
- Directly replaces OPA2350, MAX4132, MAX4281
- Small package options (SOIC-8 and MSOP-8)

Applications

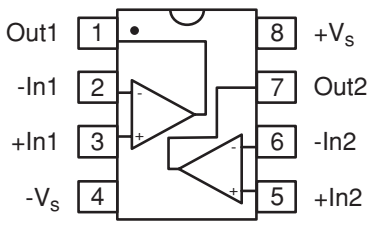
- A/D buffer
- Smart card readers
- Active filters
- Keyless entry
- Signal conditioning
- ASCI input devices
- Portable test instruments
- PCMUA cards
- Portable communications
- Bar-code readers
- Portable/battery-powered applications

KM4211 Packages

SOIC-8



MSOP-8



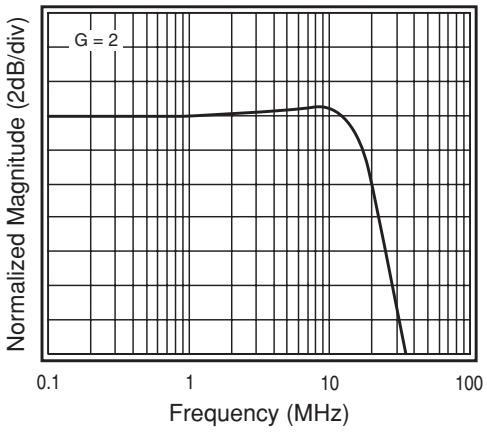
General Description

The KM4211 is a dual ultra-low power, low cost, voltage feedback amplifier. The KM4211 uses only 208μA of supply current per amplifier and is designed to operate from 2.5V to 5.5V or ±1.25V to ±2.75V supplies. The input voltage range extends 300mV below the negative rail and 1.2V below the positive rail.

The KM4211 offers high bipolar performance at a low CMOS price. The KM4211 offers superior dynamic performance with a 35MHz small signal bandwidth and 27V/μs slew rate. The combination of low power, high bandwidth, and rail-to-rail performance make the KM4211 well suited for battery-powered communication/computing systems.

The KM4112 (single) and KM4121 (single with disable) are also available.

Non-Inverting Freq. Response V_S = +5V



KM4211 Electrical Characteristics (V_s = +2.7V, G = 2, R_L = 2kΩ to V_s/2, R_f = 2.5kΩ; unless noted)

PARAMETERS	CONDITIONS	TYP	MIN & MAX	UNITS	NOTES
Case Temperature		+25°C	+25°C		
Frequency Domain Response					
-3dB bandwidth	G = +1, V_O = 0.05V_{pp}	28		MHz	1
	G = +2, V_O < 0.2V_{pp}	15		MHz	
full power bandwidth	G = -1, V_O = 2V_{pp}	7		MHz	
gain bandwidth product		16		MHz

General Description

The KM4211 is a single supply, general purpose, voltage-feedback amplifier fabricated on a complementary bipolar process. The KM4211 offers 35MHz unity gain bandwidth, 27V/μs slew rate, and only 208μA supply current. It features a rail-to-rail output stage and is unity gain stable.

The design utilizes a patent pending topology that provides increased slew rate performance. The common mode input range extends to 300mV below ground and to 1.2V below V_S. Exceeding these values will not cause phase reversal. However, if the input voltage exceeds the rails by more than 0.5V, the input ESD devices will begin to conduct. The output will stay at the rail during this overdrive condition.

The design uses a Darlington output stage. The output stage is short circuit protected and offers "soft" saturation protection that improves recovery time.

The typical circuit schematic is shown in Figure 1.

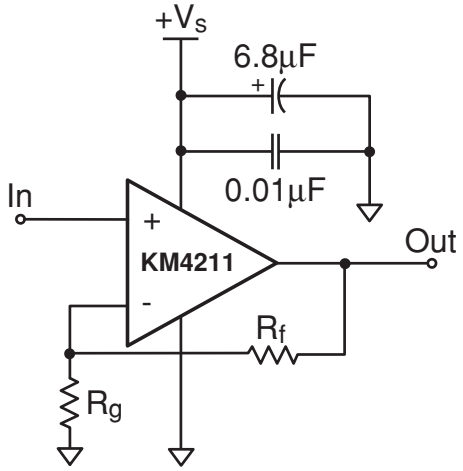

Figure 1: Typical Configuration

Enable/Disable Function (KM4121)

The KM4121 offers an active-low disable pin that can be used to lower its supply current. Leave the pin floating to enable the part. Pull the disable pin to the negative supply (which is ground in a single supply application) to disable the output. During the disable condition, the nominal supply current will drop to below 40μA and the output will be at high impedance with about 2pF capacitance.

Power Dissipation

The maximum internal power dissipation allowed is directly related to the maximum junction temperature. If the maximum junction temperature exceeds 150°C, some reliability degradation will occur. If the maximum junction temperature exceeds 175°C for an extended time, device failure may occur.

The KM4211 is short circuit protected. However, this may not guarantee that the maximum junction temperature (+150°C) is not exceeded under all conditions. Follow the maximum power derating curves shown in Figure 2 to ensure proper operation.

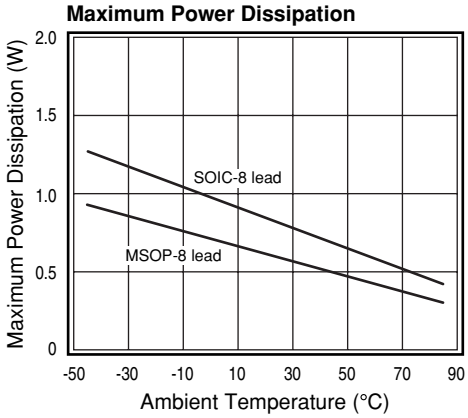

Figure 2: Power Derating Curves

Overdrive Recovery

For an amplifier, an overdrive condition occurs when the output and/or input ranges are exceeded. The recovery time varies based on whether the input or output is overdriven and by how much the ranges are exceeded. The KM4211 will typically recover in less than 20ns from an overdrive condition. Figure 3 shows the KM4111 in an overdriven condition.

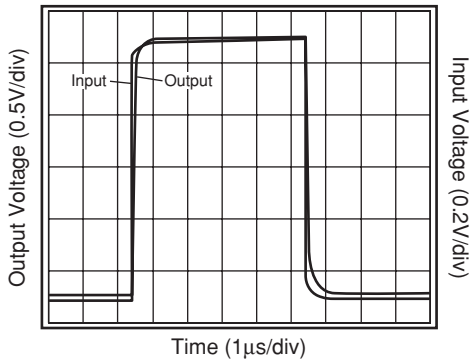

Figure 3: Overdrive Recovery

Driving Capacitive Loads

A small series resistance (R_s) at the output of the amplifier, illustrated in Figure 4, will improve stability and settling performance.

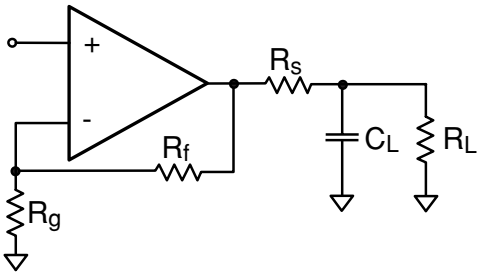

Figure 4: Typical Topology for driving a capacitive load

Layout Considerations

General layout and supply bypassing play major roles in high frequency performance. Fairchild has evaluation boards to use as a guide for high frequency layout and to aid in device testing and characterization. Follow the steps below as a basis for high frequency layout:

- Include 6.8μF and 0.01μF ceramic capacitors
- Place the 6.8μF capacitor within 0.75 inches of the power pin
- Place the 0.01μF capacitor within 0.1 inches of the power pin
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance
- Minimize all trace lengths to reduce series inductances

Refer to the evaluation board layouts shown in Figure 6 for more information.

When evaluating only one channel, complete the following on the unused channel

1. Ground the non-inverting input
2. Short the output to the inverting input

Evaluation Board Information

The following evaluation boards are available to aid in the testing and layout of this device:

Eval Board	Description	Products
KEB006	Dual Channel, Dual Supply 8 lead SOIC	KM4211IC8
KEB010	Dual Channel, Dual Supply 8 lead MSOP	KM4211IM8

Evaluation board schematics and layouts are shown in Figure 5 and Figure 6.

The KEB006 evaluation board is built for dual supply operation. Follow these steps to use the board in a single supply application:

1. Short $-V_S$ to ground
2. Use C3 and C4, if the $-V_S$ pin of the KM4111 or KM4121 is not directly connected to the ground plane.
