DATA SHEET

LA72702VA — Monolithic Linear IC For US TV BTSC Decoder

Overview

The LA72702VA is a US TV BTSC Decoder.

Features

- With SIF circuit, alignment-free* STEREO channel separation.
  * When Base Band signal input, separation is adjusted by input level.
- Dual Slave address.

Functions

- IF FM-Demodulator.
- STEREO decoder.
- dbx Noise Reduction.
- STEREO detection.
- STEREO detection sensitivity change function.
- SAP demodulator.
- SAP detection.
- SAP output select 2-levels.
- SAP detection sensitivity change function.

Specifications

Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum power supply voltage	V_{CC} max		7.0	V
Allowable power dissipation	Pd max	Ta ≤ 70°C *	290	mW
Operating temperature	Topr		-10 to +70	°C
Storage temperature	Tstg		-55 to +150	°C

* When mounted on a 114.3mm×76.1mm×1.6mm glass epoxy board.

SANYO Semiconductor Co., Ltd.
TOKYO OFFICE Tokyo Bldg., 1-10, 1 Chome, Ueno, Taito-ku, TOKYO, 110-8534 JAPAN

Operating Ranges at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Recommended operating voltage	V_{CC}		5.0	V
Allowable operating voltage range	V_{CC} op		4.5 to 5.5	V

Caution : Please use this IC under license contract with THAT Corporation, because this IC is included dbx noise reduction system.

Electrical Characteristics at Ta = 25°C, V_{DD} = 5.0V

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max

I²C BUS serial interface specification

(1) Data Transfer Manual

This IC adopts control method(I²C-BUS) with serial data, and controlled by two terminals which called SCL(serial clock) and SDA (serial data).At first, set up[*1] the condition of starting data transfer, and after that, input 8 bit data to SDA terminal with synchronized SCL terminal clock. The order of transferring is first, MSB (the Most Scale of Bit), and save the order. The 9th bit takes ACK (Acknowledge) period, during SCL terminal takes 'H', this IC pull down the SDA terminal. After transferred the necessary data, two terminals lead to set up and of [*2] data transfer stop condition, thus the transfer comes to close.

*1 Defined by SCL rise down SDA during 'H' period.
*2 Defined by SCL rise up SDA during 'H' period.

(2) Transfer Data Format

After transfer start condition, transfers slave address (1000 000∗) to SDA terminal, control data, then, stop condition (See figure 1).
Slave address is made up of 7bits, 8th bit[*3] shows the direction of transferring data, if it is 'L' takes write mode (As this IC side, this is input operation mode), and in case of 'H' reading mode (As this IC side, this is output operation mode). Data works with all of bit, transfer the stop condition before stop 8bit transfer, and to stop transfer, it will be canceled the transfer dates.

*3 It is called R/W bit.

Fig.1 DATA STRUCTURE "WRITE" mode

START Condition	Slave Address	R/W<u>L</u>	ACK	Control data	ACK	STOP condition

Fig.2 DATA STRUCTURE "READ" mode

START condition	Slave Address	R/W<u>H</u>	ACK	Internal Data *	ACK	STOP condition

∗ Output data as follows ;
bit8 is result of STERO DET (H : STEREO), bit7 is result of SAP DET (H : SAP),
bit6 to bit1 are fixed to 'L'

(3) Initialize

This IC is initialized for circuit protection. Initial condition is "0 (All bits) ".

I^2C Timing Specifications

Parameter	Symbol	min	max	unit
LOW level input voltage	V_{IL}	-0.5	1.5	V
HIGH level input voltage	V_{IH}	3.0	5.5	V
LOW level output current	I_{OL}		3.0	mA
SCL clock frequency	f_{SCL}	0	100	kHz
Set-up time for a repeated START condition	$t_{SU:STA}$	4.7		µs
Hold time START condition. After this period, the first clock pulse is generated	$t_{HD:STA}$	4.0		µs
LOW period of the SCL clock	t_{LOW}	4.7		µs
Rise time of both SDA and SDL signals	t_R	0	1.0	µs
HIGH period of the SCL clock	t_{HIGH}	4.0		µs
Fall time of both SDA and SDL signals	t_F	0	1.0	µs
Data hold time :	$t_{HD:DAT}$	0		µs
Data set-up time	$t_{SU:DAT}$	250		ns
Set-up time for STOP condition	$t_{SU:STO}$	4.0		µs
BUS free time between a STOP and START condition	t_{BUF}	4.7		µs
