Ordering number:EN2367B

CMOS IC

LC6512A, LC6513A

Single-Chip 4-Bit Microcomputer for Control-Oriented Applications (Low-Threshold Input, On-Chip FLT Driver)

DISCONTINUED PRODUCT

General Description

The LC6512A, 6513A are microcomputers that are dentical with FLT driver-contained microcomputers LC6502D, 6505D in instruction set but are further enhanced in performance, such as shorter cycle time, more stack levels, increased FLT drive capacity, and are partially changed in specifications for standby function. Since the LC6512A, 6513A are also pin-compatible with the LC6502D, 6505D, they can be used as similar replacements for the LC6502D, 6505D. The LC6512A, 6513A can replace the LC6502B/6502D, 6505B/6505D to enhance performances of equipment in which these microcomputers have been applied so far.

Features

- Low power dissipation CMOS single-chip microcomputer.
- Instruction set with 79 instructions common to the LC6502C, 6502B, 6502D/LC6505C, 6505B, 6505D.
- 2-source, 2-level interrupt function (external interrupt/internal timer interrupt)
- 8-level stack
- 4-bit prescaler-contained 8-bit programmable timer
- FLT driver-contained output ports and low-threshold input ports
  - (1) Digits driving output ports: 10 pins
  - (2) Segments driving output ports: 8 pins
  - (3) Normal voltage input ports: 8 pins (4 pins: Low-threshold input port)
  - (4) Normal voltage input/output ports: 8-pins
- ROM, RAM
  - (1) LC6512A ROM: 2048bytes, RAM: 128 × 4bits
  - (2) LC6513A ROM: 1024 bytes, RAM: 64 × 4bits
- Cycle time 1.33μs min.
  400kHz, 800kHz, 1MHz, 3MHz ceramic resonator OSC.
- Power-down by 2 standby modes
  - (1) HALT mode: Power dissipation saving by program standby during normal operation
  - (2) HOLD mode: Power supply backup during power failure
  - (3) The standby function is the same as for the LC6514B and its using method is different from that of the LC6502D, 6505D, etc.

• Differences among LC6512D, 6513D,and LC6512A, 6513A
The LC6512D, 6513D and LC6512A, 6513A are different in the OSC circuit only and are the same in the basic features. The differences are shown below.

Item	LC6512A, 6513A	LC6512D. 6513D
OSC circuit configuration	1-stage inverter	5-stage inverter
OSC mode	Ceramic resonator OSC	Ceramic resonator OSC, CR OSC, application of external clock
OSC waveform	Sine wave	Rectangular wave
Operating frequency	Ceramic resonator OSC: 500kHz, 800kHz,1MHz, 3MHz	Ceramic resonator OSC: 400kHz, 800kHz, 1 MHz CR OSC: 400kHz typ, 800kHz typ External clock: 222kHz to 1290kHz

DISCONTINUED PRODUCT

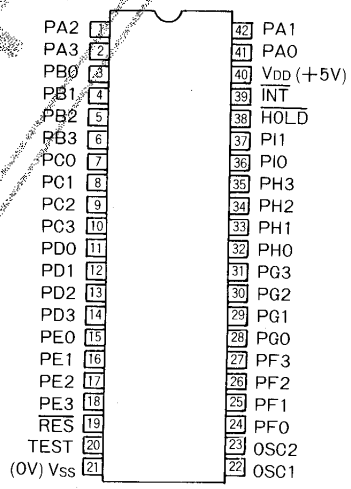
Technical Data

The LC6512A, 6513A are members of our LC6500 series of CMOS microcomputers. For their internal functions, refer to the LC6500 SERIES USFR′S MANUAL. Those which differ from the description in the USER′S MANUAL are described in this catalog. Carefully study features and Appendix 4 Standby Function in this catalog before using the LC6512A, 6513A.

Pin Assignments

Pin Name

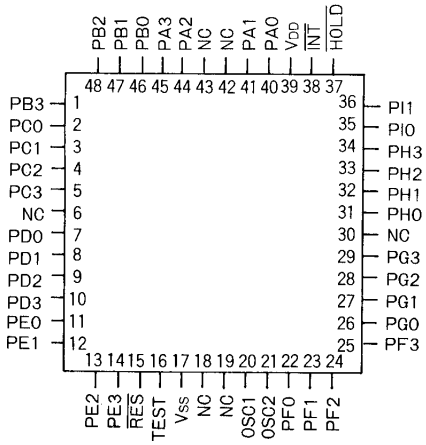
OSC1, OSC2 : Ceramic resonator for OSC
$\overline{INT}$: Interrupt
$\overline{RES}$: Reset
$\overline{HOLD}$: Hold
PAO-3 : Input port A0–3
PBO-3 : Input port B0–3
PCO-3 : Input/output common port C0–3
PDO-3 : Input/output common port D0–3
PEO-3 : Output port (High-voltage port) E0–3
PFO-3 : Output port (High-voltage port) F0–3
PGO-3 : Output port (High-voltage port) G0–3
PHO-3 : Output port (High-voltage port) H0–3
PI0, 1 : Output port (High-voltage port) I0, 1
TEST : Test



DIP42S

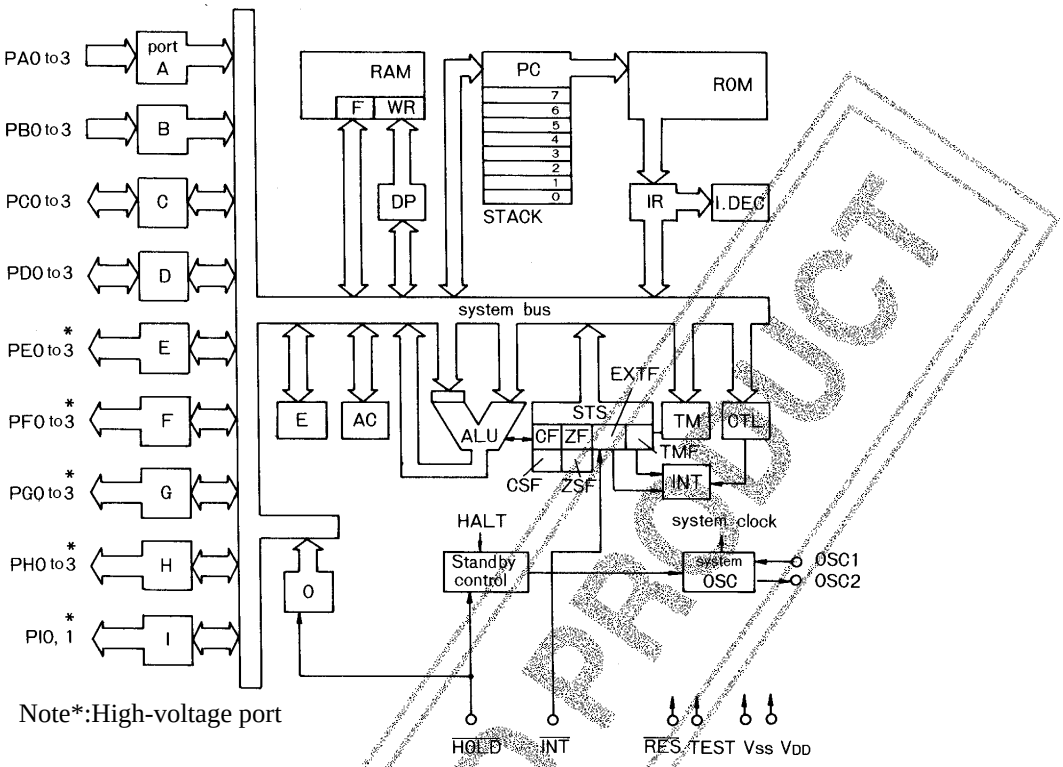
(Note) Nothing must be connected to NC pins internally or externally.

When mounting the QIP version on the board, do not dip it in solder.



QIP48A

System Block Diagram



Note*:High-voltage port

RAM	: Data memory	STS	: Status register
F	: Flag	ROM	: Program memory
WR	: Working register	PC	: Program counter
AC	: Accumulator	INT	: Interrupt control
ALU	: Arithmetic and logic unit	IR	: lnstruction register
DP	: Data pointer	I.DEC	: lnstruction decoder
E	: E register	CF, CSF	: Carry flag, carry save flag
CTL	: Control register	ZF, ZSF	: Zero flag, zero save flag
OSC	: Oscillation circuit	EXTF	: External interrupt request flag
TM	: Timer	TMF	: Internal interrupt request flag

DISCONTINUED PRODUCT

Pin Description

Pin Name	Input/Output	Function
$\overline{INT}$	Input	Interrupt request input pin
$\overline{HOLD}$	Input	HOLD mode request input pin (The LC6502, 6505 differ in function.) Capable of being used as a general-purpose single-bit input port unless the standby mode is used.
$\overline{RES}$	Input	Reset input pin
PA_{0-3}	Input	Input port A_0 to A_3 (Normal voltage, low-threshold input) Capable of 4-bit input and single-bit decision for branch Use also for HALT mode release request input

Continued on next page.

Continued from preceding page.

Pin Name	Input/Output	Function
PB_{0-3}	Input	Input port B_0 to B_3 (Normal voltage) Capable of 4-bit input and single-bit decision for branch
PC_{0-3}	Input/Output	Input/output common port C_0 to C_3 (Normal voltage) Capable of 4-bit input and single-bit decision for branch during input Capable of 4-bit output and single-bit set/reset during output
PD_{0-3}	Input/Output	Input/output common port D_0 to D_3 (Normal voltage) Capable of 4-bit input and single-bit decision for branch during input Capable of 4-bit output and single-bit set/reset during output
PE_{0-3}	Output	Output port E_0 to E_3 (Digit driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PF_{0-3}	Output	Output port F_0 to F_3 (Digit driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PG_{0-3}	Output	Output port G_0 to G_3 (Segment driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
PH_{0-3}	Output	Output port H_0 to H_3 (Segment driver output) Capable of 4-bit output and single-bit set/reset Capable of 4-bit input of output latch contents and single-bit decision of output latch for branch
$PI_{0, 1}$	Output	Output port I_0, I_1 (Digit driver output) Capable of 2-bit output and single-bit set/reset Capable of 2-bit input of output latch contents and single-bit decision of output latch for branch
0SC1	Input	A ceramic resonator is connected to this pin and pin OSC2 in the internal clock mode.
0SC2	Output	Pin for externally connecting a resonance circuit for the internal clock mode
V_{DD}	Input	Power supply pin Normally connected to +5V.
V_{SS}		Connected to 0V power supply
TEST	Input	IC test pin Normally connected to V_{SS}(0V)

Specifications

Absolute Maximum Ratings at Ta = 25˚C, V_{SS}=0V

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V_{DD} max		–0.3 to +7.0	V
Input voltage	V_{IN}	Input pins other than OSC1	–0.3 to V_{DD}+0.3 (Note1)	V
Output voltage	V_{OUT}(1)	Ports C,D OSC2	–0.3 to V_{DD}+0.3	V
	V_{OUT}(2)	Ports E,F,G,H,I	V_{DD}–45 to V_{DD}+0.3	V
Peak output current	$I_{O(1)}$	Ports C,D:Each pin	–2.0 to +2.0	mA
	$I_{O(2)}$	Ports E,F,I:Each pin	–15 to 0	mA
	$I_{O(3)}$	Ports G, H:Each pin	–10 to 0	mA
	$I_{O(4)}$	All pins of ports C to I	–90 to +16	mA
Allowable power dissipation	Pd max(1)	Ta=–30 to +70°C (Flat package)	350	mW
	Pd max(2)	Ta=–30 to +70°C (DIP)	600	mW
Operating temperature	Topr		–30 to +70	˚C
Storage temperature	Tstg		–55 to +125	˚C

(Note1) For pin OSC1, up to oscillation amplitude generated when internally oscillated under the recommended oscillation conditions in Fig. 2 is allowable.

[Note] When mounting the QIP package version on the board, do not dip it in solder.

DISCONTINUED PRODUCT

Allowable Operating Conditions at Ta = –30 to +70°C, V_{DD} = 5V±10%, V_{SS} = 0V,

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Operating supply voltage	$V_{DD(1)}$		4.5	5.0	5.5	V
Power-down supply voltage	$V_{DD(2)}$	HOLD mode: $\overline{HOLD}$=$V_{IL(3)}$	1.8		5.5	V
Input high-level voltage	$V_{IH(1)}$	Port A	1.9		V_{DD}	V
	$V_{IH(2)}$	Ports B, C, D	$0.7V_{DD}$		V_{DD}	V
	$V_{IH(3)}$	$\overline{INT}$, $\overline{RES}$, $\overline{HOLD}$ and OSC1	$0.8V_{DD}$		V_{DD}	V
Input low-level voltage	$V_{IL(1)}$	Ports B, C, D	V_{SS}		$0.3V_{DD}$	V
	$V_{IL(2)}$	$\overline{INT}$, $\overline{RES}$, OSC1	V_{SS}		$0.2V_{DD}$	V
	$V_{IL(3)}$	$\overline{HOLD}$,TEST: V_{DD}=1.8 to 5.5V	V_{SS}		$0.2V_{DD}$	V
	$V_{IL(4)}$	Port A	V_{SS}		0.5	V
External capacitance for ceramic resonator OSC	C1	See Fig. 2.				
	C2	See Fig. 2.				
Allowable delay in key scan circuit	t_{DH}	See Figs. 3-3, 3-4 in Appendix 3.			(N-2) Xtcyc*	µs
	t_{DL}				(N-2) Xtcyc*	µs
Standby timing	t_{VDDF}	V_{DD}=1.8 to 5.5V, See Fig. 1.	0			µs
	t_{VDDR}	V_{DD}=1.8 to 5.5V, See Fig. 1.	0			µs

(Note)* tcyc: Cycle time at microcomputer running mode

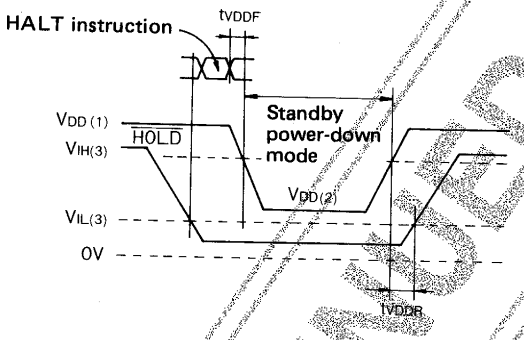


Fig. 1 Standby mode timing

[Note]
No chattering shall be applied to the $\overline{HOLD}$ pin and PA0 to 3 pins during the HALT instruction execution cycle.

Appendix 1. Support System

For application development of the LC6512A, 6513A, the support system for the LC6512A, 6513A is used.

1-1. Software support

The support system provides source editor, cross assembler. For cross assembler on CP/M, the "LC6502.COM", "LC6505.COM" are used, and on MS-DOS, the "LC6512.COM", "LC6513.COM" are used.

1-2. Hardware support

(1) Evaluation chip

Evaluation chip LC6597 is used. Level converters, drivers are connected to high-voltage ports (PE_0 to $_3$, PF_0 to $_3$, PG_0 to $_3$, PH_0 to $_3$, PI_0, $_1$) externally.

(A dedicated adaptor is available.)

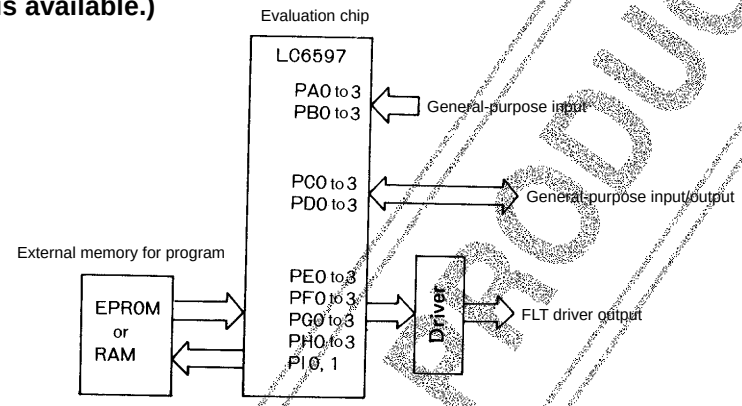

Fig. 1-1 Basic evaluation system using evaluation chip

(2) Simulation chip

Piggyback LC65PG12/13 and adaptor (EVA-97-12D/13D) for the LC6512A, 6513A are used jointly.

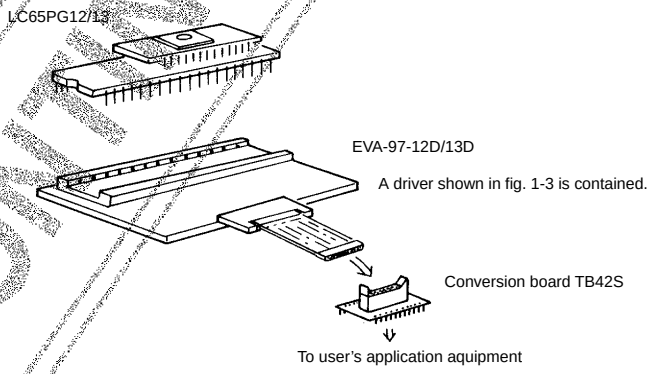

Fig. 1-2 How to use piggyback

DISCONTINUED PRODUCT

(3) Evaluation kit

The EVA-410 and EVA-TB2 are used. For connecting with user's application equipment, adaptor (EVA-97-12D/13D) is used.

(4) Adaptor (EVA-97-12D/13D)

This is used when evaluating the LC6512A, 6513A with the aid of the evaluation chip and piggyback. This contains drivers for FLT. (See Figs. 1-3, 1-4.)

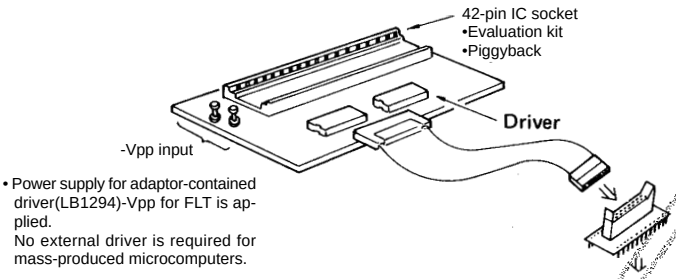

Fig. 1-3 Adaptor (EVA-97-12D/13D) for LC6512A, 6513A

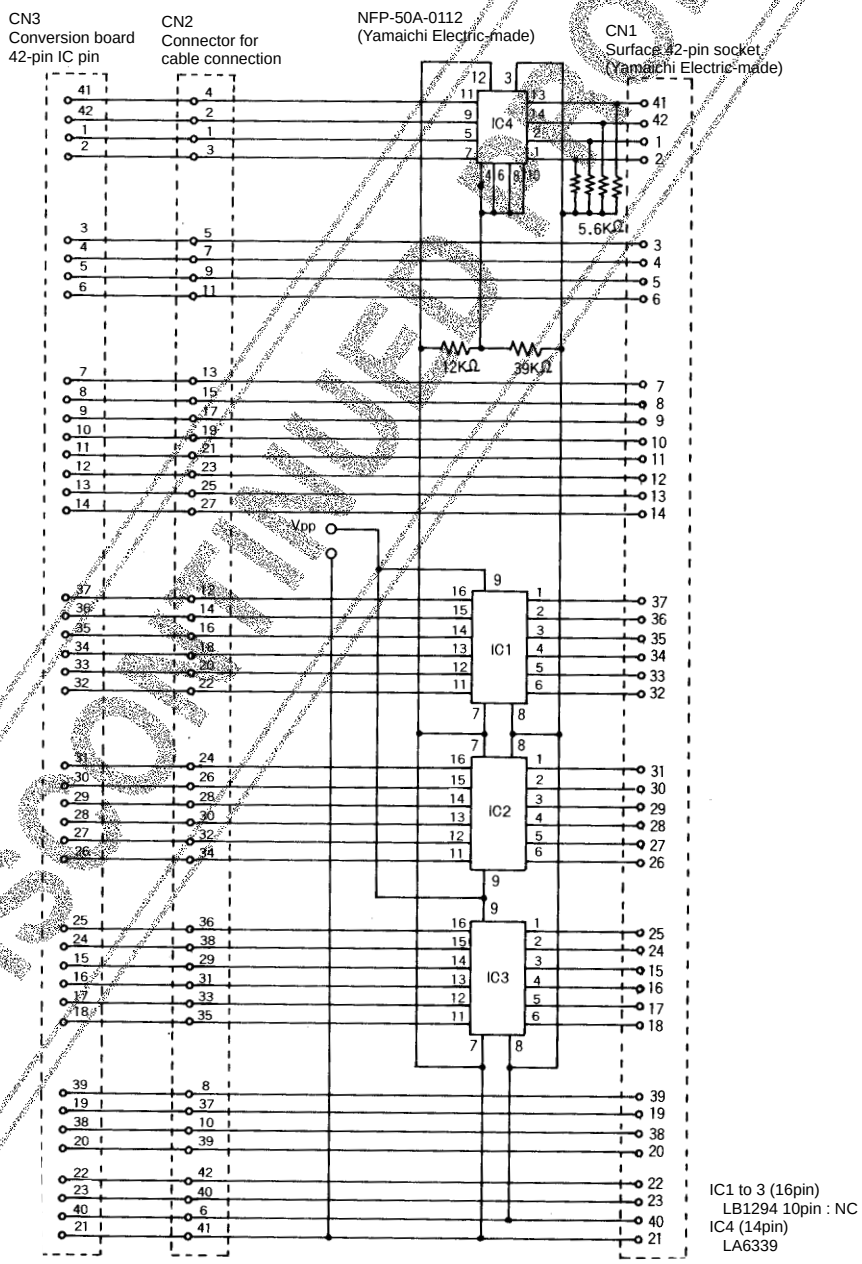

Fig. 1-4 EVA-97-12D/13D

DISCONTINUED

Appendix 2. Internal Architecture of LC6512A, 6513A

The LC6512A, 6513A are identical with the LC6502C, 6505C in the internal architecture and instruction set except that output ports are of high-voltage type and port A is of low-threshold input type and the standby function is the same as for the LC6514B. For details, refer to "LC6500 SERIES USER'S MANUAL"; and for the standby function, refer to Appendix 4 "Standby Function".

2-1. PC

For the LC6512A, 6513A, this is organized with an 11-bit, 10-bit binary counter, respectively, which specifies the ROM address of an instruction to be executed next. The high-order 3(2) bits specify a page and the low-order 8 bits specify an address in the page. The page is updated automatically. ( ) is for the LC6513A.

2-2. ROM

This is used to store user programs. For the LC6512A, 6513A,this is organized with 2048x 8 bits, 1024 x 8 bits, respectively. By using the ROM table read instruction, the whole area can be accessed and the display pattern can be programmed.

2-3. Stack

This is used to save the contents of the PC at the subroutine call or interrupt mode. This allows subroutine nesting up to 8 levels.

2-4. DP

This is a register organized with 4-bit DPL and 3-bit, 2-bit DPH for the LC6512A, 6513A, respectively. When accessing the data RAM, the DPL, DPH specify a column address, row address, respectively. When accessing input/output ports, the DPL specifies port A to port l. The DPL also specifies internal pseudo port O.

2-5. RAM

This is a static RAM used to store data. For the LC6512A, 6513A, this is organized with 128 x 4 bits, 64 x 4 bits, respectively. Row address 7H(3H) is allocated for 16 flags and 8 working registers which can be manipulated without being addressed by the DP. ( ) is for the LC6513A.

2-6. AC, E

The AC is a 4-bit register which stores data to be processed by instructions. The E register is an auxiliary register to be back up the AC and is used as a temporary register or general-purpose register at the instruction execution mode.

2-7. ALU

This is a circuit which performs arithmetic and logic operations specified by individual instructions. This outputs not only data of operation results but also the status of carry (C), zero (Z).

2-8. Status register

This is a 4-bit register which stores the status of carry, zero and the external interrupt, timer interrupt request.
The contents of the status register can be tested by the branch instructions.

2-9. Timer

This consists of a 4-bit fixed prescaler and an 8-bit programmable timer. This counts the system clock and requests a timer interrupt when an overflow occurs.

2-10. Control register

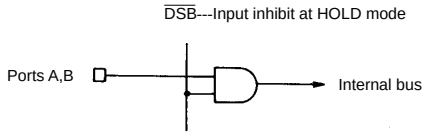
This is a 4-bit register, 2-bits of which control input/output of input/output common ports C, D and 2-bits of which enable/disable external interrupt, internal timer interrupt.

2-1 1. Input/output ports

There are 9 ports/34 pins from port A to I. Each port is addressed by the DPL. Ports A, B are of normal-voltage input type, ports C, D are of normal-voltage input/output common type, and ports E, F, G, H, I contain FLT drivers. Port A is of low-threshold input type.

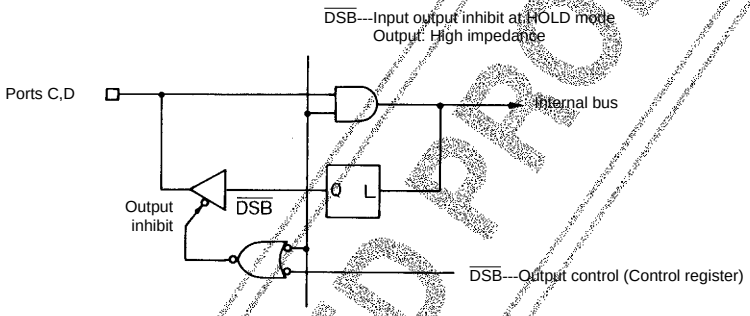
DISCONTINUED PRODUCT

(1) Ports A_0 to 3, B_0 to 3



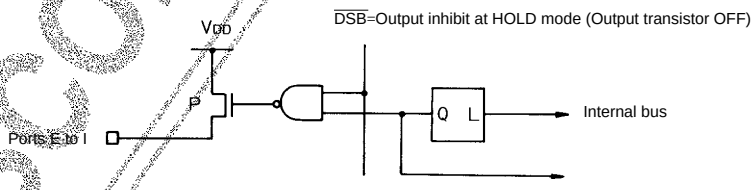
Functions
- 4-bit input (IP instruction)
- Single-bit test (BP, BNP instructions)
- Port A: Low-threshold input
- Port B: Normal-threshold input

(2) Ports C_0 to 3, D_0 to 3



Functions
1. Input mode (Output inhibit)
   - 4-bit input (IP instruction)
   - Single-bit test (BP, BNP instructions)
2. Output mode
   - 4-bit output (OP instruction)
   - Single-bit set, reset (SPB, RPB instructions)

(3) Ports E_0 to 3, F_0 to 3, G_0 to 3, H_0 to 3, I_0 to 1 (High-voltage ports)



Functions
- 4-bit (2-bit for port I) output (OP instruction)
- 4-bit (2-bit for port I) input of output latch contents (IP instruction)
- Single-bit set, reset (SPB, RPB instructions)
  - Set: The output represents a 1. ----- Output transistor ON
  - Reset: The output represents a 0. ----- Output transistor OFF
- Single-bit test of output latch contents (BP, BNP instructions)
- PortsE, F, I: FLT digits drive
- Ports G, H: FLT segments drive

DISCONTINUED PRODUCT

2-12. External interrupt

The trailing edge of the signal on the $\overline{INT}$ pin is detected and the interrupt request flag in the status register is set. The occurrence of an interrupt is controlled by the enable/disable flag in the control register.

2-13. Reset

The system is initialized by setting the $\overline{RES}$ pin to L-level. The contents to be initialized are as follows:

- PC Address 000H
- Control register 0000 → Interrupt disable, Ports C, D: Output inhibit
- Status register Timer, external interrupt flag → Reset
- Output port Output latch (0_H) → Output transistor OFF

Appendix 3. Proper Cares in Using IC

3-1. Low-threshold input port A_0 to $_3$ provides the input characteristic shown in Fig. 3-1.

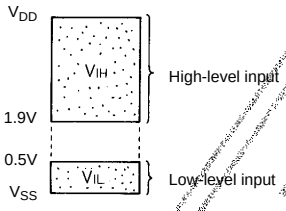


Fig. 3-1

3-2. FLT driver output

Ports E_0 to $_3$, F_0 to $_3$, I_0 to $_1$ (10 pins) are for high-current digits driver output; and ports G_0 to $_3$, H_0 to $_3$ (8 pins) are for intermediate-current segments driver outputs. Of course, digits driver outputs can be used as segments driver outputs. Fig. 3-2 shows a sample application.

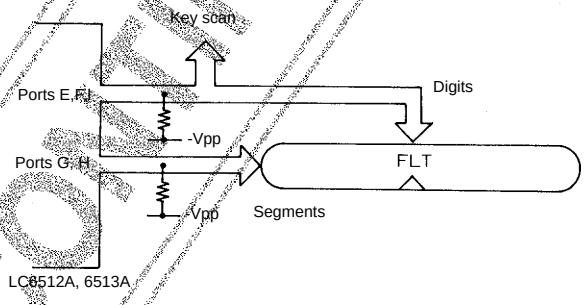

Fig. 3-2 FLT display application

DISCONTINUED PRODUCT

Digit drive signal-used key scan

When key-scanning with the FLT digit drive signal in Fig. 3-3 and inputting the return signal to port A, the following must be observed.

(a) Estimate voltage drop (V_{ON}) in the output transistor using the current flowing in an FLT used and the V-I characteristic of the output port of the LC6512A, 6513A.
(b) Estimate voltage drop (V_{SW})in the switch circuit.
(c) Check to see that $V_{ON} + V_{SW}$ meets the V_{IH}/V_{IL} requirement of the input port in Fig. 3-1.

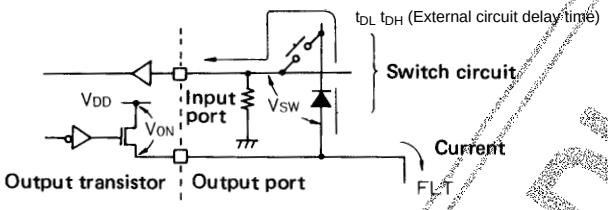

Fig. 3-3 Sample key scan application

For the key scan application in Fig. 3-3, make the program considering the delay in the external circuit and the input delay shown below.

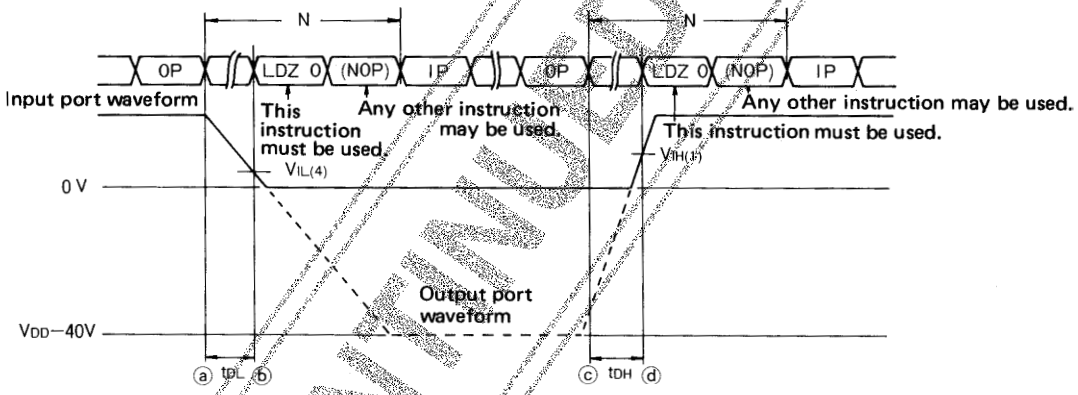

Fig. 3-4

When the IP instruction is used to input the return signal as shown above, the input delay must be considered and two instructions are placed between the IP instruction and the crossing of input port waveform and $V_{IL(4)}$, $V_{IH(1)}$, respectively. Some instructions must be placed additionally according to the length of delay (t_{DL}, t_{DH}) in the external circuit after the digit drive signal is delivered with the execution of the OP instruction (point a and point c).

N: Number of instruction cycles existing between instruction (OP, SPB, RPB) used to output data to output port and instruction (IP, BP, BNP) used to input data from input port.
(Number of instruction cycles to be programmed according to the length of t_{DL}, t_{DH})

t_{DL}, t_{DH}: Delay in external circuit from output port to input port.

DISCONTINUED PRODUCT

Appendix 4. Standby Function

Two standby modes – HALT mode and HOLD mode – are available to minimize the power dissipation when the program is in the wait state or a power failure is backed up. Both modes are set with the execution of the HALT instruction. All the operations including the system clock generator are stopped at the standby mode. (For other models LC6502/05 of the LC6500 series, the HOLD mode is hardware-set with the $\overline{\text{HOLD}}$ pin = "L". Be careful of the difference in the mode setting method.)

The HALT mode and HOLD mode are used properly depending on the purposes. They are different in the mode setting conditions, I/O port state during standby operation, mode releasing method. The HALT mode is entered by executing the HALT instruction when the $\overline{\text{HOLD}}$ pin is at H-Level. The HALT mode is used to save the power dissipation when the program is in the wait state. The HOLD mode is entered by executing the HALT instruction when the $\overline{\text{HOLD}}$ pin is at L-Level. At the HOLD mode all I/O ports are disabled and there is no power dissipation in the interfaces with external circuits, permitting capacitor or battery-used power supply backup during power failure.

4-1. HALT mode setting

The HALT mode is entered by executing the HALT instruction when the $\overline{\text{HOLD}}$ pin is at H-Level and all pins for port A_0 to A_3 are at L-Level. When even one of pins for port A_0 to A_3 is at H-Level, the HALT instruction is disregarded and becomes equal to the NOP instruction.

The HALT mode causes individual blocks to be placed in the following states.

(1) Operation is stopped

- All the operations including the system clock generator are stopped.

(2) I/O port

- The state immediately before setting the HALT mode is held.

(3) Blocks to be cleared/reset

- Timer.....State where all bits are set to "1"(max.time).
- Status flag.....The EXTF, TMF are reset (interrupt disable). The CF, ZF contents are held. An interrupt request at the HALT mode is disregarded.

(4) Blocks to be held

- For the registers, data RAM, port output latch, PC (except those in (3), the contents immediately before setting the HALT mode are held.

4-2. HOLD mode setting

The HOLD mode is entered by executing the HALT instruction when the $\overline{\text{HOLD}}$ pin is at L-Level. ln this case, the contents of port A_0 to A_3 remain unaffected.

The state in the HOLD mode is the same as that in the HALT mode, except the state of I/O port. The HOLD mode permits the undermentioned power-down mode to be entered.

I/O port

- lnput ports A, B: lnput inhibit
- Input/output port C, D: Input inhibit, output high impedance
- Output ports E to I: Output Pch transistor OFF
- INT, RES pins: Input inhibit

For the output latch of the output port, the contents immediately before setting the HOLD mode are held.

DISCONTINUED PRODUCT

4-3. HOLD power-down mode setting

The HOLD mode permits the supply voltage to be lowered and also the power dissipation to be reduced after mode setting. The HOLD mode can be used in the capacitor or battery-used backup operation during power failure.

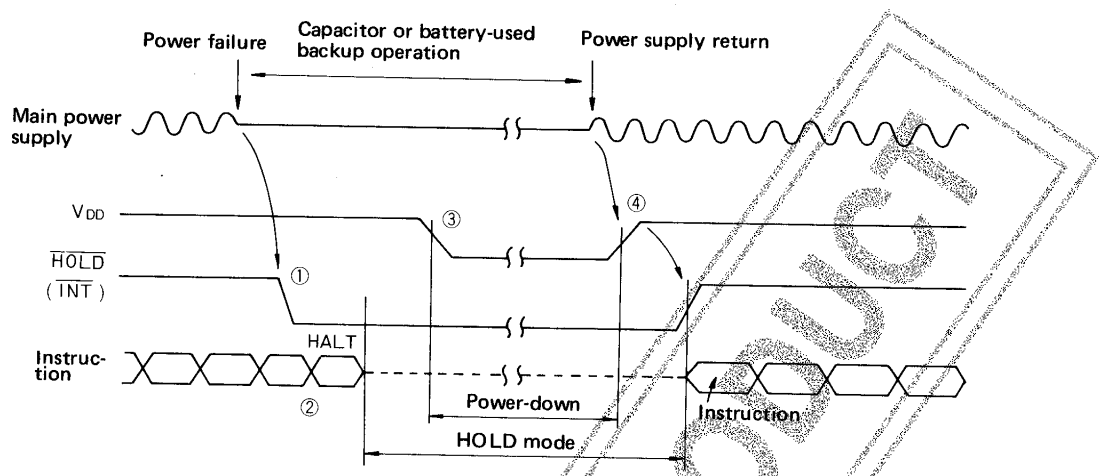

Fig. 4-1 HOLD mode and power-down

① A failure of the main power supply is detected and a standby request is made. This is hardware-controlled by the external circuit.

② The $\overline{HOLD}$ pin is software-polled or the same signal is applied to the $\overline{INT}$ pin to test the standby request by interrupt. Then, the HALT instruction is executed and the HOLD mode is entered. (Note)

③ After the HOLD mode is entered, power-down can be attained by lowering V_{DD}.

④ After V_{DD} returns to the prescribed voltage, the $\overline{HOLD}$ pin is set to H-Level and the normal operation returns.

(Note) The $\overline{HOLD}$ pin input signal is transferred to pseudo input port PO 0 (DPL = 0EH, 2^0 bit). Therefore, when polling the $\overline{HOLD}$ pin, the BP0 or BNP0 instruction is used at DPL = 0EH. (The IP instruction cannot be used.)

When the BP0 instruction is used for testing, a branch occurs when the input voltage is at high level in the same manner as for normal input ports.

4-4. HALT mode release

Release by reset

When L-Level is applied to the RES pin, the HALT mode is released and the system reset state is entered.

When the $\overline{RES}$ pin is set to H-Level again, the normal operation starts. Since the ceremic resonator mode is used for system clock generation, the release by reset must be performed.

–Notes–

• Since the ceramic resonator mode is used for system clock generation, L-Level must be applied to the $\overline{RES}$ pin for 5 to 10 ms (oscillation stabilizing time).

Mode change from HALT mode to HOLD Mode

The HALT mode is entered with the execution of the HALT instruction when the $\overline{HOLD}$ pin is at H-Level.

The HALT mode is changed to the HOLD mode automatically by setting the $\overline{HOLD}$ pin to L-Level.

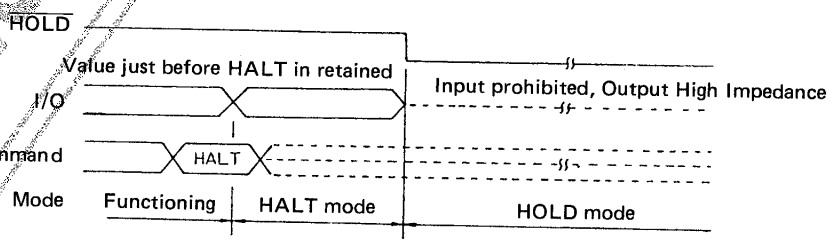

Fig. 4-2 Mode change from HALT modeto HOLD mode

DISCONTINUED PRODUCT

4-5. HOLD mode release

Release by reset

The HOLD mode is released by setting the $\overline{\text{HOLD}}$ pin to H-Level while applying L-Level to the $\overline{\text{RES}}$ pin. When the $\overline{\text{RES}}$ pin is set to H-Level again, the normal operation starts. The contents of the memories remain unaffected except the PC, I/O ports, registers which are initialized by the reset operation.

Since the ceramic resonator mode is used, the reset state must be held until oscillation is fully stabilized (10 ms after oscillation start) after the HOLD mode is released.

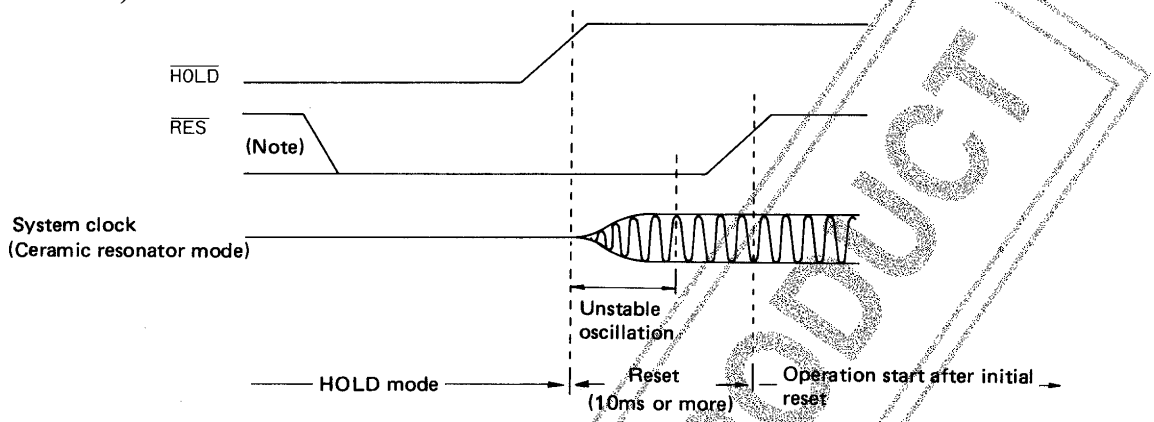

Fig. 4-3 HOLD mode release by reset

Note: With L-Level applied to the $\overline{\text{HOLD}}$ pin as shown above, the CPU is not reset even when the $\overline{\text{RES}}$ pin is set to L-Level. This is because the $\overline{\text{HOLD}}$ pin is given priority lest the CPU is reset unnecessarily when the capacitor or battery-used backup mode causes the CPU peripherals to operate unstably and the $\overline{\text{RES}}$ pin is set to L-Level. Be careful of the level of the $\overline{\text{HOLD}}$ pin and $\overline{\text{RES}}$ pin also at the initial reset mode when power is applied. When the $\overline{\text{HOLD}}$ pin is at L-Level, no reset occurs.

4-6. Proper cares in using standby function

When using the HOLD mode, an application circuit and program must be designed with the following in mind.

(1) The supply voltage at the standby state must not be less than specified.

(2) Input timing of each control signal ($\overline{\text{HOLD}}$, $\overline{\text{RES}}$, port A, $\overline{\text{INT}}$, etc.) at the standby initiate/release state.

(3) Release operation must not be overlapped at the time of execution of the HALT instruction.

4-7. Sample application where the standby function is used for power failure backup

Power failure backup is an application where power failure of the main power source is detected by the $\overline{\text{HOLD}}$ pin, etc. to cause the HOLD mode to be entered so that the current drain is minimized and a backup capacitor is used to retain the contents of the internal registers even during power failure.

4-7-1. Sample application circuit (ceramic resonator OSC)

Fig. 4-4 shows a ceramic resonator OSC-applied circuit where the standby function is used for power failure backup.

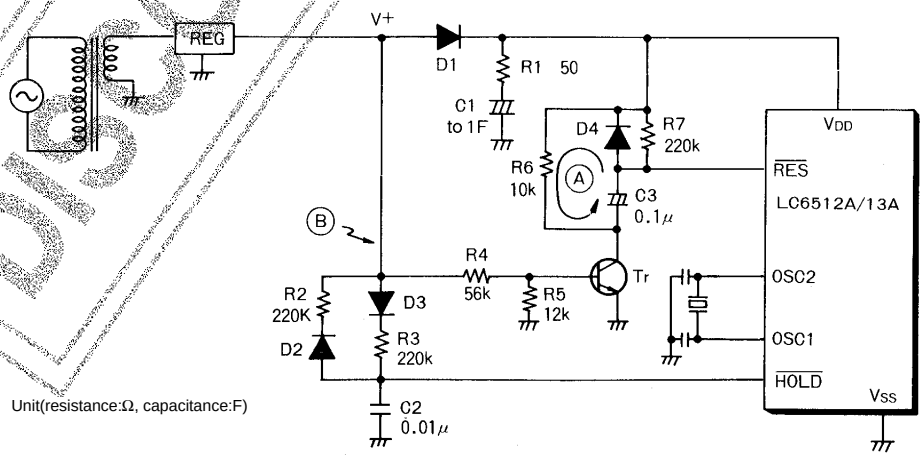

Fig. 4-4 Sample Application Circuit

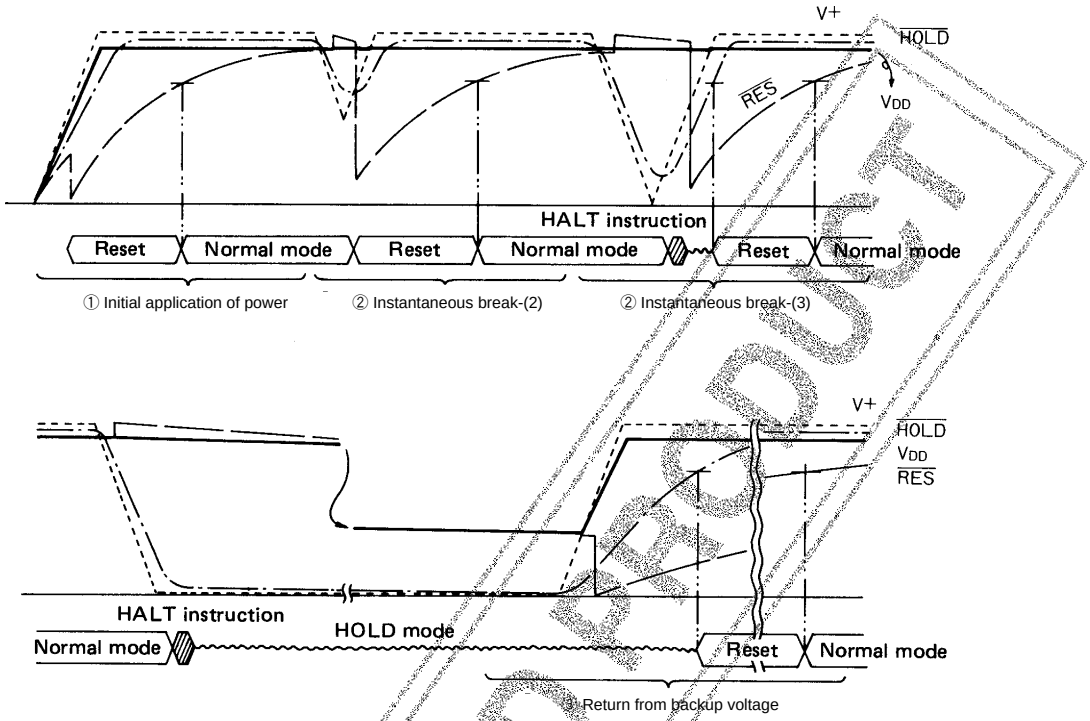
DISCONTINUED PRODUCT

4-7-2. Operating waveform

The operating waveform in the sample application circuit in Fig. 4-4 is shown below. The mode is roughly divided as follows:



4-7-3. Operation of sample application circuit

① At the time of initial application of power

A reset occurs and the execution of the program starts at address 000H of the program counter (PC).

② At the time of instantaneous break

(1) At the time of very short instantaneous break

The execution of the program continues.

(2) At the time of instantaneous break being a little longer than (1) (When the $\overline{RES}$ input voltage meets V_{IL} and the $\overline{HOLD}$ input voltage does not meet V_{IL}).

A reset occurs during the execution of the program and the execution of the program starts at address 000H of the program counter (PC).

Since the HOLD request signal is not applied to the $\overline{HOLD}$ pin, the HOLD mode is not entered.

(3) At the time of long instantaneous break (When both of the $\overline{RES}$ input voltage and $\overline{HOLD}$ input voltage meet V_{IL}).

The HOLD request signal is applied to the $\overline{HOLD}$ pin and the HOLD mode is entered.

When V+ rises after instantaneous break, a reset occurs to release the HOLD mode and the execution of the program starts at address 000H of the program counter (PC).

③ At the time of return from backup voltage

A reset occurs and the execution of the program starts at address 000H of the program counter (PC).

DISCONTINUED PRODUCT

4-7-4. Notes for circuit design

① How to fix C3, R6, C2, R2

Fix closed loop (A) discharge time constants C3, R6 and $\overline{HOLD}$ pin charge time constants C2, R2 so that closed loop (A) fully discharges before the $\overline{HOLD}$ input voltage gets lower than V_{IL} at the time of instantaneous break and the $\overline{RES}$ input voltage is sure to get lower than V_{IL} (a reset occurs) when V+ rises after instantaneous break where the $\overline{HOLD}$ input voltage gets lower than V_{IL}.

② How to fix C3, R7

Fix $\overline{RES}$ pin charge time constants C3, R7 so that when power is applied initially or the HOLD mode is released the ceramic resonator OSC oscillates normally and the $\overline{RES}$ input voltage exceeds V_{IH} and the program starts running.

③ How to fix R4, R5

Fix Tr bias constants R4, R5 so that when V+ rises after instantaneous break the $\overline{RES}$ input voltage gets lower than V_{IL} (brought to L-Level) before the $\overline{HOLD}$ input voltage exceeds V_{IH} (brought to H- Level).

④ How to fix C2, R3

Fix $\overline{HOLD}$ pin charge time constants C2, R3 so that when the $\overline{HOLD}$ mode is released from the backup mode the $\overline{HOLD}$ input voltage does not exceed V_{OH} (not brought to H-Level) until the $\overline{RES}$ input voltage gets lower than V_{IL} (brought to L-Level).

Fix C3, R7 and C2, R3 so that the time interval from the moment the $\overline{HOLD}$ input voltage exceeds V_{IH} until the moment the $\overline{RES}$ input voltage exceeds V_{IH} is longer than the ceremic resonator OSC stabilizing time.

⑤ When the load is heavy or the polling interval is long

Since Cl discharges largely, increase the capacity of C1 or separate (B) detection from V+ and use a power supply or signal that rises faster than V+.

4-7-5. Notes for software design

When the HOLD request signal is detected, the HALT instruction is executed immediately. A concrete example is shown below.

(1) An interrupt is inhibited before polling the HOLD request pin ($\overline{HOLD}$ pin).

(2) Polling of the $\overline{HOLD}$ pin and the HALT instruction are programmed consecutively.

[Concrete example]

```
        ⋮
    RCTL    3     ;EXTEN, TMEN ← 0 (External, timer interrupt inhibit)
    BP0     AAA   ;Polling of the HOLD pin (If H-Level, a branch occurs to AAA.)
    HALT          ;The HOLD mode is entered.
        ⋮
AAA:
```

Mnemonic is BNP0 to BNP3 according to the value of t.
	BTTM addr	Branch on timer	0 1 1 1 $P_7P_6P_5P_4$	1 1 0 0 $P_3P_2P_1P_0$	2	2	PC7 to 0←P7P6P5P4 P3P2P1P0 If TMF=1 then TMF←0	If theTMF is 1,a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.The TMF is reset.	TMF	

SUBJECT TO CHANGE

Instruction	Mnemonic		Instruction code $D_7D_6D_5D_4$	Instruction code $D_3D_2D_1D_0$	Bytes	Cycles	Function	Description	Status flag affected	Remarks
Branch instructions	BNTM addr	Branch on no timer	0 0 1 1 $P_7P_6P_5P_4$	1 1 0 0 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If TMF=0 then TMF←0	If the TMF is 0, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs. The TMF is reset.	TMF	
	BI addr	Branch on interrupt	0 1 1 1 $P_7P_6P_5P_4$	1 1 0 1 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If EXTF=1 then EXTF←0	If the EXTF is 1, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs. The EXTF is reset.	EXTF	
	BNI addr	Branch on no Interrupt	0 0 1 1 $P_7P_6P_5P_4$	1 1 0 1 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If EXTF=0 then EXTF←0	If the EXTF is 0, a brance to an address specified by immediate data P_7 to P_0 within the current page occurs. The EXTF is reset.	EXTF	
	BC addr	Branch on CF	0 1 1 1 $P_7P_6P_5P_4$	1 1 1 1 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If CF=1	If the CF is 1, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		
	BNC addr	Branch on no CF	0 0 1 I $P_7P_6P_5P_4$	1 1 1 1 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If CF=0	If the CF is 0, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		
	BZ addr	Branch on ZF	0 1 1 I $P_7P_6P_5P_4$	1 1 1 0 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If ZF=1	If the ZF is 1, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		
	BNZ addr	Branch on no ZF	0 0 I I $P_7P_6P_5P_4$	1 1 1 0 $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If ZF=0	If the ZF is 0, a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		
	BFn addr	Branch on flag bit	1 1 0 1 $P_7P_6P_5P_4$	$n_3n_2n_1n_0$ $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If Fn=1	If a flag bit of the 16 flags specified by immediate data $n_3n_2n_1n_0$ is 1,a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		Mnemonic is BFO to BF15 according to the value of n.
	BNFn addr	Branch on no flag bit	1 0 0 1 $P_7P_6P_5P_4$	$n_3n_2n_1n_0$ $P_3P_2P_1P_0$	2	2	$PC_{7\text{ to }0}\leftarrow P_7P_6P_5P_4P_3P_2P_1P_0$ If Fn=0	If a flag bit of the 16 flags specified by immediate data $n_3n_2n_1n_0$ is 1,a branch to an address specified by immediate data P_7 to P_0 within the current page occurs.		Mnemonic is BNFO to BNF15 according to the value of n.
Input/Output instructions.	IP	Input port to AC	0 0 0 0	1 1 0 0	1	1	AC←[P(DP$_L$)]	The contents of port P(DPL) are inputted to the AC.	ZF	
	OP	Output AC to port	0 1 1 0	0 0 0 1	1	1	P(DP$_L$)←(AC)	The AC contents are outputted to port P(DP$_L$).		
	SPB bit	Set port bit	0 0 0 0	0 1 B_1B_0	1	2	P(DP$_L$ B_1B_0)←1	Immediate data B_1B_0- specified one bit in port p(DP$_L$)is set.		Mnemonic is BNFO to BNF15 according to the value of n.
	RPB bit	Reset port bit	0 0 1 0	0 1 B_1B_0	1	2	P(DP$_L$ B_1B_0)←0	Immediate data B_1B_0- specified one bit in port p(DP$_L$)is reset.	ZF	When this instruct-ion is executed,the E register contents are destroyed.
Other instructions	SCTL bit	Set control register bit(S)	0 0 1 0 1 0 0 0	1 1 0 0 $B_3B_2B_1B_0$	2	2	CTL←(CTL)$\vee$ $B_3B_2B_1B_0$	Immediate data $B_3B_2B_1B_0$-specified bits in the control register are set.		
	RCTL bit	Reset control register bit(S)	0 0 1 0 1 0 0 1	1 1 0 0 $B_3B_2B_1B_0$	2	2	CTL←(CTL)$\wedge\overline{B_3B_2B_1B_0}$	Immediate data $B_3B_2B_1B_0$-specified bits in the control register are reset.	ZF	
	WTTM	Write timer	1 1 1 1	1 0 0 1	1	1	TM←(E).(AC) TMF ←0	The E and AC contents are loaded in the timer. The TMF reset.	TMF	
	HALT	Halt	1 1 1 1	0 1 1 0	1	1	Halt	All operations stop.		
	NOP	No operation	0 0 0 0	0 0 0 0	1	1	No operation	No operation is performed, but 1 machine cycle is consumed.		

*1 If the LI instruction or CLA instruction is used consecutively in such a manner as LI, LI, LI……,or CLA, CLA, CLA, ……, the first LI instruction or CLA instruction only is effective and the following LI instructions or CLA instructions are changed to the NOP instructions.

DISCONTINUED PRODUCT

Note
(1) The Branch instructions include the following instructions, and only when the branch conditions are met immediate data of ROM is loaded in the PC.
BAt BPt BI BZ
BNAt BNPt BNI BNZ
BMt BTM BC BFn
BNMt BNTM BNC BNFn
(2)AC^{Z,C}-----Suffix Z, C represent that the ZF, CF flags of the status register are affected.

DISCONTINUED PRODUCT

- Specifications of any and all SANYO products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.
- SANYO Electric Co., Ltd. strives to supply high-quality high-reliability products. However, any and all semiconductor products fail with some probability. It is possible that these probabilistic failures could give rise to accidents or events that could endanger human lives, that could give rise to smoke or fire, or that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO products(including technical data,services) described or contained herein are controlled under any of applicable local export control laws and regulations, such products must not be exported without obtaining the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written permission of SANYO Electric Co., Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only ; it is not guaranteed for volume production. SANYO believes information herein is accurate and reliable, but no guarantees are made or implied regarding its use or any infringements of intellectual property rights or other rights of third parties.

This catalog provides information as of October, 2001. Specifications and information herein are subject to change without notice.
